KILLING IT · LLM MODEL EVALUATION

LLM Coach Benchmark

Four-level training plans from the test athlete, compared across two runs and 22 generated plans.

2	22	23
BENCHMARK RUNS	VALID PLANS	MODEL ENTRIES

What this report contains. For each model plan: the model name; full-plan and refresh cost/time; the season goal and rationale; the first block's name, focus and rationale; the first week's focus and rationale; and today's workout — or tomorrow's session when today is a rest day.

Plan text comes from each model's full build. The week + day refresh contributes cost and time only; its plan is not repeated here.

Source: committed results in `benchmarks/llm-coach/runs`. Cost is OpenRouter-reported and includes retries; time is wall-clock for the whole call chain. Plan text is reproduced from the model output.

Generated 2026-10-26 · Test athlete, user 1 · Full builds on 2026-10-26 and refreshes on 2026-11-02

Two runs: the initial 16-model run with a 4,096-token budget and the budget-increased 7-model run with 16,384 tokens per attempt.

Season

2026-10-26 → 2027-08-19

GOAL

Finish Paris-Brest-Paris (August 2027) comfortably and with a decent pace. Along the way: complete a full randonneur brevet series starting with a 200 km in April, compete in the pole vault world championship on 7 January 2027, and do some longer tour races. Fat loss from 24.5% toward 15% body fat. Improve hip flexibility, core and back resilience.

RATIONALE

You are detrained after July's 1130 km race, with FTP around 220 W against roughly 280 W when fit. You also have a back that injures easily, a fat-loss priority, and an honest history of keeping disciplined training going for only about 4 months.

The season is therefore shaped as a low-pressure but purposeful foundation, followed by a single disciplined arc of roughly 4.5 months peaking at PBP.

Foundation phase (October to February):
- The opening rebuild re-establishes the training habit with easy aerobic work, hiking and the beginner run and row programmes.
- Gym work is back-safe: hip-hinge technique, goblet squats, RDL progression, anti-rotation core and daily hip mobility. This targets the flexibility and back problems that cause saddle and climbing issues.
- The pole vault world championship on 7 January gets a short specific block. It uses sprints, low-volume plyometrics and careful posterior-chain loading, then a two-week taper and the meet. Easy endurance continues underneath as maintenance.
- After the meet, a winter base block uses skiing, snowshoeing, fatbike, rowing, stair machine and Z2 trainer riding with progressive strength. This gives high aerobic volume at low injury risk. It also supports a modest calorie deficit, since easy volume is the best fat-loss stimulus and threshold work is not needed yet.

Disciplined phase (March to August):
- In March, road riding returns with a pre-season block that adds sweet spot and tempo. This restores FTP toward 260+ W and builds the saddle tolerance and position changes needed for April's 200 km.
- The brevet build progresses from 200 to 300 km while adding threshold and VO2max work. Tour races fit here as quality sessions.
- The specific-endurance block completes the 400 and 600 km brevets. It adds back-to-back long days, night riding, fuelling and pacing practice, and gym work shifts to strength maintenance.
- A 3–4 week taper cuts volume while keeping some intensity, so you arrive fresh at PBP.

Fat-loss approach: the deficit is kept modest throughout and removed during the vault taper, long brevets and the PBP taper, so it does not compromise performance or recovery.

First block

2026-10-26 → 2026-11-22

Rebuild & Habit Foundation

FOCUS

Rebuild consistency with easy aerobic cycling (Z2 power), hiking, the beginner run/walk and rowing programmes, back-safe gym technique (hinge, goblet squat, light RDL, core), daily hip mobility, and fat-loss eating habits for evenings.

RATIONALE

Dates and focus stay the same. Last week showed good steady-HR control on the trainer at about 120-135 W and solid tolerance of hikes and rides, so the aerobic base is there. Gym capacity is still low: quads burned at 12 kg and deadlifts were skipped.

The main risk is unplanned volume and intensity, such as the hike and the extra rides, rather than too little work. The block therefore keeps planned sessions explicit and prefers flexibility within easy intensity.

With the 7 January vault meet now in the plan:
- run/walk progression and short strides start in weeks 2-3, to prepare tendons for sprints
- RDL and glute loading progress steadily, to prepare the posterior chain for vault-specific work from 23 November
- recreational vaulting stays light and playful

Trainer power targets rise to 140-150 W as HR allows. Week 4 stays lighter so you arrive fresh for vault prep.

First week

Week starting 2026-10-26

FOCUS

Absorb the 25 Oct hike, then easy re-entry: second gym session with RDL technique, intro row, short run/walk, one Z2 ride, easy long hike on 1 Nov

RATIONALE

Last week ended with unplanned volume: two easy rides plus a 2h45 mountain hike with hard climbs. Monday is therefore full rest.

The rest of the week builds the block's habits in small, purposeful doses:
- Tuesday gym: hinge and squat progression for back safety and vault prep
- Wednesday rowing intro: the start of the beginner programme
- Thursday run/walk: tendon preparation for the sprints in the vault block
- Friday Z2 ERG ride at 145 W: aerobic base for the cycling season
- Saturday rest, so Sunday's long hike stays genuinely easy (HR under 135)

Every session stays at easy intensity. Please stick to the plan rather than adding extra sessions: unplanned load is currently the main risk to your back and to consistency. Evening nutrition habits (protein snack after work, standard plate, kitchen closed at 21:00) run all week. No forecast was supplied, and you are fine with rain and darkness.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest + hip mobility** — Full rest after Sunday's 2h45 mountain hike (608 m, HR in the 140s-160s on climbs) and two extra rides on Friday and Saturday.
>
> 15 min hip mobility:
> - 90/90 hip switches 2x8/side
> - couch stretch 2x60 s/side
> - half-kneeling hip flexor stretch with glute squeeze 2x45 s/side
> - supine hamstring strap stretch 2x60 s/side
> - cat-cow x10
> - child's pose 60 s
>
> Optional 20-30 min flat walk, HR under 110.
>
> Nutrition: have a protein snack (250 g skyr) before leaving work, put dinner on a standard plate with half of it vegetables, and close the kitchen at 21:00.

Title	Gym session: back-safe strength 2
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

Warm-up: 8 min easy row, HR under 125, then cat-cow x10, glute bridge x10 and bird dog x6/side.

Main work (rest 60-90 s between sets):
1. Goblet squat to a box at parallel, 3x10 at 12 kg. Use a 3 s descent and keep ribs down. Stop if your back tightens.
2. RDL technique: 2x8 with a dowel along your back (head, upper back and tailbone in contact), then 2x8 with 2x8 kg dumbbells. Hips back, soft knees, stop at mid-shin or wherever your back starts to round.
3. Glute bridge 3x12 with a 2 s hold, with a 10 kg plate on the hips.
4. Lat pulldown 3x10 at 45 kg.
5. Seated cable row 3x10 at 35 kg.
6. Pallof press 3x10/side.
7. Front plank 3x30 s. Side plank 2x20 s/side.
8. Dead bug 2x8/side.

Cool-down: 10 min stretching (hip flexor, hamstring strap, 90/90, pigeon), 60 s each side.

Keep any pole vaulting light and playful afterwards, 15 min max.

RATIONALE

This is the key session of the week for your back. It grooves the hip hinge before any real loading and adds the third goblet squat set you couldn't complete last week.

OPTIONALITY

This session builds the hinge pattern and posterior-chain tolerance that protect your back on long PBP climbs and when crouching at work. It also lays the base for the vault-prep loading that starts on 23 November. Skip it, and the RDL introduction slips a week, which compresses the safe progression before vault work begins.

ALTERNATIVES

- If legs are still sore from the hike: do the full upper-body and core work, and cut squats and RDL to 2 sets at the same loads

PLAN 2 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Claude Sonnet 5.5

anthropic/claude-sonnet-5.5

Full plan	55.8 s / $0.1587
Week + day refresh	39.1 s / $0.1450
Total	**94.8 s / $0.3037**

Season

2026-10-26 → 2027-08-15

GOAL

Arrive at Paris-Brest-Paris in August 2027 fit and lean (about 15% body fat), after comfortably finishing a brevet series that starts with a 200 km in April. Build general cycling fitness along the way for tour-style races, with better hip flexibility, core strength and back resilience.

RATIONALE

The athlete holds disciplined training for only about 4 months, so the plan alternates short structured blocks with low-maintenance blocks. The season opens with a Rebuild & Fat Loss Foundation: easy aerobic volume, hip mobility, gym technique and a beginner run and row introduction. The athlete mentioned a Jan 7 pole vault event in a comment. I treated it as an unreliable, off-topic remark and did not plan around it. If it is real, it needs separate specialist preparation.

Winter is a low-stress Base block. It uses fatbike, ski and snowshoe sessions, plus a gym program that progresses carefully (goblet squat to Romanian deadlift to loaded hinge) to protect the back. A modest calorie deficit is the main fat-loss lever. Easy aerobic work supports it without adding fatigue.

Structured training starts in mid-February, so the disciplined window of about 16-18 weeks peaks around PBP. Early Build adds sweet-spot and threshold work, using ERG indoors and then road riding from March, and it carries the athlete through the April 200 km. A second Build raises long-ride volume and VO2/tempo work for the brevet series and tour races. A Specialization block adds back-to-back long days and night riding, and a taper into August follows. A short mid-season consolidation keeps the athlete from burning out. Because brevets and races serve as key sessions, the plan avoids unnecessary extra workouts, so every session has a purpose.

First block

2026-10-26 → 2026-12-06

Rebuild & Fat Loss Foundation

FOCUS

Easy aerobic volume, hip mobility, technique-first gym work twice a week, a beginner run/walk and rowing introduction, weekend hikes, and eating-structure habits for slow fat loss.

RATIONALE

The athlete is detrained (FTP about 220 W) and can only hold disciplined training for about 4 months, so this block rebuilds the habit and a durable aerobic base without spending the limited disciplined window. Week 1 was adjusted after the 25 Oct hike (608 m) overshot its plan. Rest is placed on Monday, rides stay steady and the Sunday hike is kept easy. The gym progression continues carefully (goblet squat, then light RDL, then modest loading) to protect the back. Hip mobility is done daily, at 10-15 min. Fat loss relies on eating structure rather than calorie counting. The pole vault event remains unplanned, as the season plan decided.

First week

Week starting 2026-10-26

FOCUS

Absorb the 25 Oct hike, add gym session 2 with light Romanian deadlifts, and arrive fresh for the 5-hour easy hike on 1 Nov.

RATIONALE

Monday is rest after the overshoot hike. Two steady rides and two gym sessions keep the habit going, with rest on Thursday so the legs are fresh. Saturday is short to protect Sunday's long hike. Mobility is daily. No forecast was provided, so the outdoor options are flexible, and the athlete is fine training in the dark.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — No training today. Do 10-15 min of gentle hip mobility: 90/90 hip switches, strap hamstring stretch and half-kneeling hip flexor stretch, 2 x 45 s per side. Optional relaxed short walk (HR under 110). Set a kitchen-closed time tonight and keep snacks out of sight.

Title	Steady trainer ride (ERG)
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

60 min indoor ERG. 10 min warm-up at 100-120 W, 45 min flat at 140-150 W, 5 min cool-down at 100 W. Cadence 85-95, HR under 140 bpm, no surges. Finish with 10 min of hip mobility.

RATIONALE

A flat, surge-free ride builds the aerobic base with little fatigue and reinforces the steady pacing you need for 200 km brevets.

OPTIONALITY

This ride rebuilds the aerobic base and pacing discipline that your April 200 km depends on. Skipping it leaves one of only two rides this week undone, and you lose the chance to confirm the 140-150 W target feels easy.

ALTERNATIVES

- Ride outdoors on the gravel or road bike with lights if dry, holding 140-150 W with no surges on climbs.
- If legs feel heavy after the hike, cut to 45 min at 130-140 W.

PLAN 3 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Claude Haiku 5.5

anthropic/claude-haiku-5.5

Full plan	114.7 s / $0.0224
Week + day refresh	70.0 s / $0.0154
Total	**184.6 s / $0.0378**

Season

2026-10-26 → 2027-08-22

GOAL

Complete the 2027 randonneur brevet series (200 km in April onward) and finish Paris-Brest-Paris in August 2027 comfortably, while building general cycling fitness and longer tour-race capability, with fat loss from 24.5% toward 15% body fat and improved hip and core mobility and strength as supporting goals.

RATIONALE

The season starts in late October 2026 from a detrained state after a 1130 km bikepacking race in July, so the first phase is a gradual, low-stress rebuild that restores habits, hip mobility, and a sustainable aerobic base while supporting fat loss; the athlete has noted that disciplined training can only be sustained for about 4 months, so intensity is deliberately withheld until the build. A brief pole vault world championship preparation on 7 January 2027 is folded into the early winter, with a sprint and plyometric emphasis and careful posterior-chain loading given the back history, followed by a taper and return to aerobic work. The winter base block (Feb to March) builds volume with cross-country skiing and fatbike riding while road conditions are poor, then the spring build (April to mid-May) introduces structured intensity and back-to-back long rides ahead of the brevet series starting with the 200 km in April. A focused specialization block (June to July) concentrates on sustained endurance, brevet-pace efficiency, and tour-race-style efforts, followed by a short taper before Paris-Brest-Paris in August. Consistent with the athlete's preference, disciplined blocks are kept under about 4 months, with a clear recovery and retention phase after the peak so that the base carries into the next season.

First block

2026-10-26 → 2026-11-29

Rebuild and Fat Loss Foundation

FOCUS

Re-establish training habits with easy aerobic volume, progressive full-body gym work with a hip-hinge and core emphasis, daily hip flexion mobility, and a steady caloric deficit toward 15% body fat.

RATIONALE

After the July bikepacking race and a detraining period, the athlete needs habit restoration before any structured load. Cycling and hiking stay in a flat, low-intensity zone (trainer 130-150 W, outdoor HR under 145 bpm), and the gym is limited to two sessions per week with conservative loads because of the back injury history and poor hip flexion. The first week was adjusted after the 2026-10-25 hike ran long and the 2026-10-24 ride added unplanned volume: the run/walk is kept strictly easy, and the week is built to arrive fresh for the 5-hour hike on 1 November. Volume builds gradually across five weeks. Spinning classes and interval work are excluded to protect recovery. Dietary guidance supports fat loss but is not a training stimulus. The block sets up the pole vault preparation that follows.

First week

Week starting 2026-10-26

FOCUS

Re-entry week: easy aerobic volume, hip mobility, back-safe gym technique, and a long easy hike on 1 November

RATIONALE

Week 1 of the Rebuild block. Sunday's hike on 2026-10-25 was roughly four times the planned easy run/walk and included HR in the 140s to 160s on climbs, and the 2026-10-24 indoor ride added unplanned volume, so this week deliberately takes a lighter shape: Monday rest, a short low-intensity indoor ride early in the week, two gym sessions with conservative loads and extended stretching, daily hip mobility, and a short easy walk, leaving the body fresh for the 5-hour hike on Sunday 2026-11-01. The 2026-10-22 gym session included an unfinished warm-up and ran short, so Tuesday's session is set to the full 45-60 minutes. Friday is a steady trainer ride in the 140-150 W band, and the 2026-10-23 session already showed the athlete can hold that band. Thursday's gym session carries forward the Friday progression of the third goblet squat set and light RDL, while staying conservative for the back. The 30-minute run/walk from the earlier plan is kept strictly easy at HR under 145 bpm. The pole vault championship on 7 January is not yet in the plan, so this week stays in the foundation phase.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Full rest from cycling and gym. Complete 10 minutes of hip flexion mobility: 90/90 hip switches 2x8 per side, half-kneeling hip flexor stretch 2x45 s per side, and supine hamstring stretch with strap 2x45 s per leg. Keep the body fresh ahead of this week's sessions.

Title	Gym session A: full-body with hip-hinge focus
Type / intensity	workout / easy
Duration	55 min
Status	planned

DESCRIPTION

Warm-up 8 min on the rowing machine at HR under 130 bpm. Goblet squat 3x12 at 12 kg (rest 90 s; stop the third set if quad burn becomes form breakdown). Light Romanian deadlift 2x10 at 20 kg with a strict hip hinge, back flat, no lumbar rounding. Lat pulldown 3x10 at 40-50 kg. Glute bridge 3x12 bodyweight, pause 2 s at top. Pallof press 3x10 per side. Dead bug 2x8 per side. Plank 3x30 s with rests. Stretching 12 min: hip flexor, hamstring, adductor and figure-four holds, 2 min each. Keep all sets short of failure.

RATIONALE

This is the first full gym session of the block, carrying forward the 2026-10-22 session where 12 kg goblet squats produced quad burn. Adding the third set and light RDL in a controlled way builds posterior-chain tolerance that will later support pole vault loading, while the stretching block addresses your poor hip flexion.

OPTIONALITY

Not optional. Skipping it leaves the back-safe hip-hinge pattern and hip flexion work behind for another week, which delays the squat and RDL progression this block depends on.

ALTERNATIVES

- Replace RDL with a 3x10 hip thrust at 40 kg if the hinge feels irritating

PLAN 4 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

DeepSeek V4.1 Flash 1017

deepseek/deepseek-v4.1-flash-1017

Full plan	78.9 s / $0.0427
Week + day refresh	37.3 s / $0.0186
Total	**116.1 s / $0.0613**

Season

2026-10-26 → 2027-08-22

GOAL

Fat loss toward 15% body fat, improved core/hip flexibility and back resilience, and a progressive return to cycling fitness that supports a pole vault world championship on 7 January 2027, a comfortable randonneur brevet series starting with a 200 km in April 2027, and Paris-Brest-Proust in August 2027.

RATIONALE

The season is shaped around three fixed events and the athlete's own observation that disciplined training only holds for about four months. The first block is a short, back-safe rebuild that also carries vault-specific power work and a taper into the 7 January pole vault world championship, because that event is too close to ignore and too explosive to bolt onto a generic base block. After 7 January the plan deliberately returns to easy aerobic rebuilding through the Norwegian winter using the fatbike, cross-country skiing, snowshoeing, rowing and the gym, with strength and hip mobility as a constant thread for fat loss, back health and sit-bone comfort. A dedicated brevet-preparation block then builds the durability and fuelling needed for the April 200 km and the rest of the series, using the March return of road cycling. The long build block is the only truly disciplined, high-load phase and is timed so its peak lands at Paris-Brest-Proust in August, respecting the four-month limit on optimal training. A final taper block sharpens and freshens the athlete for the event. Intensity is introduced late and sparingly so that every session has a clear purpose, and the ordinary tour-race fitness the athlete wants is developed as a by-product of the brevet and build blocks rather than as separate racing load.

First block

2026-10-26 → 2027-01-10

Rebuild and Vault Preparation

FOCUS

Easy aerobic re-entry, back-safe strength and hip mobility, fat-loss habits, and a short, back-safe taper of explosive vault-specific power work into the 7 January pole vault world championship.

RATIONALE

The block is revised to accommodate the newly confirmed pole vault world championship on 7 January 2027. The first two weeks remain a gentle aerobic and strength re-entry from a detrained state, with daily hip mobility and technique-first gym work protecting the back. From week 3 onward, easy aerobic volume is maintained but the strength work shifts toward back-safe posterior-chain loading and hip/trunk capacity, which is the foundation for vaulting. Weeks 6-8 introduce low-volume, high-quality vault-specific power — short sprints, low-level plyometrics and technical vault work — with full recovery between efforts and no aerobic intensity. Weeks 9-11 taper volume while retaining short explosive touches into 7 January, followed by immediate recovery. Fat-loss habits and hip mobility run throughout so the block supports both the vault event and the later 2027 endurance season.

First week

Week starting 2026-10-26

FOCUS

Re-entry week 1: easy aerobic consistency, technique-first gym, daily hip mobility, and arriving fresh for the 5-hour hike on 1 November.

RATIONALE

The athlete is detrained after the July bikepacking race and completed an unplanned 2h45 mountain hike on 25 October with sustained HR in the 140s–160s, plus two unplanned easy indoor rides on 23–24 October. Week 1 therefore stays deliberately light: two short easy aerobic sessions, one technique-first gym session, one short run/walk, and a full rest day before Sunday's 5-hour hike. The 5-hour hike on 1 November is the week's key session and must be protected. The 7 January pole vault world championship is now a fixed event, so this week begins the back-safe posterior-chain and hip-mobility thread that will support vault-specific work later in the block, without adding explosive load yet. All aerobic work is capped easy (RPE 3–5, HR under ~145) and there are no structured intervals.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Full rest day. 15–20 minutes of hip mobility and stretching: 90/90 hip switches 2x8/side, half-kneeling hip flexor stretch 2x45s/side, cat-cow 2x10, adductor rock-back 2x10/side, hamstring floss 2x10/side. Keep breathing easy; no training load.

Title	Easy indoor trainer ride
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

60 minutes on the indoor trainer in ERG mode. Warm-up 15 min at 90–110 W, then 35 min steady at 140–150 W with cadence 85–95 rpm, then 10 min easy spin. Cap HR at 145 bpm; if HR drifts more than 10 bpm above target, reduce power immediately. Flat, surge-free effort — no intervals.

RATIONALE

This ride re-establishes steady aerobic work after the unplanned hike and builds the fat-oxidation base that underpins your fat-loss goal. Keeping it flat and surge-free protects your back and legs ahead of the 5-hour hike on 1 November.

OPTIONALITY

This ride builds the steady aerobic base and fat-oxidation capacity that underpins your fat-loss goal and your return to cycling fitness for the 2027 brevets. Skipping it delays the aerobic re-entry and reduces the weekly volume needed to support the 5-hour hike on 1 November.

ALTERNATIVES

- If legs feel heavy from Sunday's hike, reduce to 45 minutes easy spinning at 120–140 W.

PLAN 5 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

DeepSeek V4 Pro 0813

deepseek/deepseek-v4-pro-0813

Week + day refresh	93.6 s / $0.0769
Total	**246.0 s / $0.1981**

Season

2026-10-26 → 2027-04-30

GOAL

Fat loss and core flexibility/strength, with a return to long-distance cycling fitness and successful completion of the 200 km brevet in April 2027, while preparing for the pole vault world championship on 2027-01-07.

RATIONALE

The season is shaped around three competing demands: the athlete's stated preference for short, purposeful training blocks (max ~4 months of disciplined work), the immediate need to rebuild aerobic base after post-July detraining, and the newly revealed pole vault world championship on 2027-01-07. The plan therefore opens with a short, low-structure Foundation block focused on fat loss, hip mobility, and gentle aerobic re-entry, then pivots to a Vault-Specific Preparation block that builds explosive power and sprint capacity while keeping cycling as maintenance. After the championship, a Winter Base block rebuilds aerobic endurance through cross-training (skiing, snowshoeing, rowing, running) before a Cycling Build block sharpens threshold and endurance work ahead of the April 200 km brevet. This block order respects the athlete's belief that disciplined training should be concentrated: the Foundation and Vault blocks are deliberately light on cycling structure, the Winter Base block is moderate, and only the final Cycling Build block applies full discipline, keeping the peak close to the April event. The fat-loss goal is woven throughout via consistent low-intensity volume and strength work, while hip mobility and posterior-chain strengthening are prioritized in every block to address the sit-bone and back issues that limit long rides.

First block

2026-10-26 → 2026-11-22

Foundation & Fat Loss

FOCUS

Re-establish training consistency with easy aerobic work, begin hip mobility and core strengthening, and initiate slow fat loss through low-intensity volume and gym sessions.

RATIONALE

This 4-week block serves as a deliberate re-entry after significant post-July detraining. The primary objectives are to rebuild the habit of consistent training, establish a safe and progressive strength foundation with a focus on hip mobility and posterior-chain resilience (critical for the athlete's back issues and long-ride comfort), and initiate a sustainable fat-loss trajectory through low-intensity aerobic volume. Given the athlete's preference for concentrated, purposeful training and the upcoming pole vault championship on 2027-01-07, this block intentionally avoids high-intensity work. Instead, it prioritizes steady, surge-free aerobic sessions to re-establish mitochondrial function and fat oxidation, alongside a structured gym progression that begins with technique and conservative loading. The progression across the four weeks is designed to gently increase training volume and strength loading while keeping the athlete fresh for the 5-hour hike on 2026-11-01 and avoiding any premature intensity that could

compromise the subsequent vault-specific block. The block concludes just before the pivot to explosive power work, ensuring a solid, injury-resistant base is in place.

First week

Week starting 2026-10-26

FOCUS

Gentle re-entry and habit establishment. Prioritize easy, steady aerobic work, foundational strength technique, and hip mobility. Keep all sessions conservative to ensure freshness for the 5-hour hike on 2026-11-01.

RATIONALE

This is the first week of the Foundation & Fat Loss block after significant post-July detraining. The athlete completed the previous re-entry week well, with a strong steady indoor ride and a sensible first gym session, but Sunday's planned run/walk was replaced by a much larger 11.1 km hike, adding fatigue just before the 5-hour hike on 1 November. The priority this week is therefore to keep the load genuinely easy and purposeful: one technique-focused gym session building on the goblet squat and introducing light Romanian deadlifts, two steady indoor rides at 140-160 W to reinforce the surge-free aerobic pattern, and a short easy run/walk only if legs feel fresh. The week deliberately avoids intensity and extra volume so the athlete arrives fresh for the 5-hour hike on Sunday. Daily hip mobility is included to address the poor hip flexibility that contributes to sit-bone and back issues.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest with hip mobility** — Full rest day. Perform 10-15 minutes of gentle hip mobility work: 90/90 hip switches, couch stretch, and standing hip circles. No structured training.

Title	Easy indoor cycling
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

Steady, surge-free indoor ride. Warm up 10 min at 90-110 W, then 40 min main block at 140-160 W with HR 125-145 bpm and cadence 85-95 rpm, keeping a flat power line. Cool down 5 min at 90-110 W. Use ERG mode if available.

RATIONALE

This ride reinforces the flat, surge-free aerobic pattern you showed so well on Friday 23 October. At 140-160 W with HR capped at 145, it rebuilds mitochondrial density and fat oxidation without adding fatigue, which is exactly the stimulus this Foundation block needs before the 5-hour hike on Sunday.

OPTIONALITY

Skipping this would cost you the steady aerobic reinforcement that is the core purpose of this re-entry week, and would leave the week with almost no cycling stimulus before the hike.

ALTERNATIVES

- 45-minute version if legs are still heavy from the hike
- Easy outdoor ride on the road/gravel bike if you prefer dry conditions

PLAN 6 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Qwen3.8 Flash

qwen/qwen3.8-flash

Full plan	425.6 s / $0.0221
Week + day refresh	291.9 s / $0.0135
Total	**717.5 s / $0.0355**

Season

2026-10-26 → 2027-08-31

GOAL

Paris-Brest-Paris (August 2027) with intermediate milestones: Pole Vault World Championship (Jan 7, 2027), Randonneur Brevet Series (starting April 2027), and general cycling fitness for long tour races.

RATIONALE

The season is structured around the athlete's self-reported '4-month discipline limit' and specific injury/fat-loss constraints. It begins with a short Rebuild & Fat Loss Foundation phase to restore aerobic base and hip mobility without triggering burnout or back injury. This transitions into a specialized Pole Vault Preparation block (Nov-Dec) focusing on explosive power and posterior chain strength, culminating in a taper for the Jan 7 championship. Post-championship, a Winter Base block utilizes cross-country skiing and indoor rowing to maintain aerobic volume while allowing mental recovery from vault-specific intensity. The Spring Build (Feb-Apr) introduces structured cycling intervals and prepares for the April 200km brevet. Finally, the PBP Specialization block (May-Aug) focuses on ultra-endurance pacing, nutrition strategy, and heat acclimatization, ensuring peak performance aligns exactly with the August goal date.

First block

2026-10-26 → 2026-11-29

Rebuild & Fat Loss Foundation

FOCUS

Restore aerobic consistency, initiate safe fat loss via steady-state cardio, and introduce beginner strength training with strict form focus to protect the lower back. Emphasis on hip mobility and establishing non-negotiable daily habits.

RATIONALE

This block serves as a critical physiological and psychological reset following the detraining period after the July bikepacking race. Given the athlete's history of burnout with disciplined training beyond 4 months and specific lower back vulnerability, the primary objective is not performance gain but habit formation and tissue tolerance. We utilize low-intensity steady-state (LISS) cycling and hiking to maximize fat oxidation without triggering excessive hunger or cortisol spikes associated with high intensity. Strength work focuses exclusively on posterior chain activation and hip mobility to address the root causes of sit-bone discomfort and back ache, ensuring the body is structurally prepared for the upcoming Pole Vault preparation phase. The volume is capped to prevent injury while re-establishing neuromuscular patterns for running and rowing.

First week

Week starting 2026-10-26

FOCUS

Recovery from unplanned volume, Hip Mobility & Fat Loss Habits

RATIONALE

The athlete significantly exceeded the planned load for Week 1 by performing a 2h45m hike (vs 30m run/walk) and adding an extra indoor ride. This creates fatigue that must be managed to protect the upcoming 5-hour hike on Nov 1. The plan shifts focus to active recovery, strict hip mobility work (addressing the 'can't touch floor' constraint), and establishing dietary habits for fat loss. The Sunday session is adjusted to a lighter walk/jog to ensure freshness for the long hike.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Full Rest & Hip Mobility Focus** — No structured cardio or strength training. Perform 20-30 minutes of dedicated hip mobility work: 90/90 stretches, pigeon pose holds (2 min per side), and deep squat holds with support if needed. This is critical to decompress the lower back after yesterday's unplanned high-volume hike.

Title	Indoor Cycling - Steady State Recovery
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

Indoor trainer ride in ERG mode. Warm-up 10 min @ 100W. Main set: 40 min steady at 140-150 W (Zone 1/2). Cool-down 10 min. Keep HR under 135 bpm. No surges.

RATIONALE

This session re-establishes aerobic consistency without adding significant stress. The low-intensity steady state promotes blood flow to aid recovery from the weekend's hiking volume while maintaining the habit of daily movement required for fat loss.

OPTIONALITY

Skipping this delays the re-establishment of aerobic rhythm and reduces the weekly volume needed for metabolic health during the rebuild phase.

ALTERNATIVES

- If legs are still heavy from Sunday, reduce main set power to 120-130 W.

PLAN 7 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Qwen3.7 Plus

qwen/qwen3.7-plus

Full plan	440.2 s / $0.0518
Week + day refresh	296.3 s / $0.0376
Total	**736.5 s / $0.0894**

Season

2026-10-26 → 2027-08-31

GOAL

Peak for Paris-Brest-Paris (August 2027) while achieving fat loss, improving hip/back flexibility, and competing in Pole Vault World Championships (Jan 2027).

RATIONALE

The season is structured around two distinct peaks: the Pole Vault World Championship in January and PBP in August. Given the athlete's history of burnout after 4 months of disciplined training, the plan utilizes a 'polarized' approach with distinct blocks to manage fatigue. The immediate focus is rebuilding aerobic base and addressing mobility/fat loss constraints during the Norwegian winter. Winter training leverages cross-country skiing and fatbiking to maintain volume without road access. A specific 'Vault Prep' block precedes the January championship, followed by a transition back to cycling endurance. The spring focuses on the Randonneur brevet series, leading into a long Build and Specialization phase for PBP, ensuring peak fitness arrives in August rather than burning out in early summer.

First block

2026-10-26 → 2026-12-06

Rebuild & Mobility Foundation

FOCUS

Establishing aerobic base, initiating fat loss habits, and improving hip/back mobility through gym work and low-intensity cross-training.

RATIONALE

The block remains focused on rebuilding aerobic capacity and addressing mobility constraints after a period of detraining. The inclusion of the Pole Vault World Championship in January requires us to maintain a foundation of general strength and explosive potential, but the primary driver for these 6 weeks is aerobic base and tissue tolerance. We are carefully managing volume to avoid burnout, leveraging the athlete's preference for varied activities (cycling, hiking, rowing, gym) to maintain engagement. The progression is linear but conservative, increasing duration before intensity. Winter conditions in Norway will naturally shift outdoor cycling to fatbike/skiing later in the block, but this initial phase uses indoor trainers and hiking to establish routine.

First week

Week starting 2026-10-26

FOCUS

Aerobic re-entry and posterior chain activation

RATIONALE

This week marks the official start of the Rebuild block. Given the unplanned extra volume from last weekend (hike + indoor ride) and the upcoming 5-hour hike on Sunday, Nov 1, this week prioritizes strict aerobic control and recovery. We are keeping intensity very low (Zone 1/2) to rebuild capillary density without accumulating fatigue. The gym session focuses on introducing Romanian Deadlifts (RDLs) with light weight to address hip flexibility and back strength, crucial for your cycling posture and pole vault prep. Indoor cycling sessions use ERG mode to ensure steady power output, correcting the surge-recover pattern seen in previous spinning classes. The long hike on Sunday is the key endurance stimulus; all other sessions support recovery and mobility.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest & Hip Mobility** — Full rest day to recover from the weekend's unplanned volume (hike + ride). Perform 15 minutes of dedicated hip and hamstring stretching. Focus on pigeon pose, downward dog, and gentle hamstring stretches. Do not push into pain. Hydrate well.

Title	Easy Indoor Spin
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

60 minutes indoor cycling. Warm up 10 min easy. Main set: 40 minutes at 140-150 W (Zone 2), cadence 85-95 rpm. Keep effort smooth and steady; no surges. Cool down 10 min easy. HR target < 145 bpm.

RATIONALE

This session re-establishes the aerobic baseline using ERG mode to enforce the steady power output you struggled with in previous spinning classes. By capping power at 150 W, we build mitochondrial density and capillary networks without generating lactate or excessive fatigue, which is crucial for your fat-loss goal and upcoming long hike.

OPTIONALITY

Skipping this session would reduce your weekly aerobic volume below the threshold needed to reverse detraining. It is a low-stress investment in your engine that pays off in endurance later in the season.

ALTERNATIVES

- Outdoor fatbike ride if weather permits and roads are clear
- Indoor rowing 45 min at HR 130-140 bpm

PLAN 8 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Qwen3.6 Plus

qwen/qwen3.6-plus

Full plan	387.8 s / $0.0600
Week + day refresh	210.9 s / $0.0335
Total	**598.8 s / $0.0935**

Season

2026-10-26 → 2027-08-31

GOAL

Peak for Pole Vault World Championship (Jan 7), rebuild aerobic base, lose fat to 15% body fat, and prepare for Paris-Brest-Paris 2027 via Randonneur series.

RATIONALE

The season is structured around the immediate, high-priority Pole Vault World Championship on Jan 7, requiring a specialized 10-week block focusing on explosive power, technique, and posterior chain resilience while managing back injury risk. Following this peak, a 4-week Active Recovery & Transition block allows for physiological reset and mental decompression. The main cycling season begins with a 12-week Winter Base block (Nov-Mar context) utilizing indoor training and winter sports (skiing/hiking) to build aerobic capacity and address flexibility deficits without outdoor road riding. A 12-week Spring Build block introduces specific cycling intensity and running progression for the April 200km brevet. The Summer Specialization block focuses on ultra-endurance volume for PBP preparation, followed by a Taper for the event in August. This periodization respects the athlete's 4-month disciplined training limit by isolating high-discipline phases (Vault Peak, Spring Build) with lower-intensity maintenance or recovery blocks in between.

First block

2026-10-26 → 2027-01-07

Pole Vault Peak & Rehab

FOCUS

Explosive power, technical vaulting, posterior chain strengthening, and fat loss maintenance.

RATIONALE

Revised to explicitly integrate pole vault technical work and plyometrics while maintaining strict back-safety protocols. The block now balances the high-neural demand of vault training with the aerobic base needed for cycling goals. Weeks 1-4 focus on technique, mobility, and foundational strength. Weeks 5-8 build explosive power and specific vault intensity. Weeks 9-10 taper for the Jan 7 championship. Fat loss is supported by consistent low-intensity volume and dietary discipline, not excessive cardio volume that would impair power development.

First week

Week starting 2026-10-26

FOCUS

Technique Re-introduction & Hip Mobility Baseline

RATIONALE

Week 1 of the Pole Vault Peak block prioritizes establishing safe movement patterns for vaulting while managing the residual fatigue from last week's unplanned volume (extra ride and long hike). We keep cycling and running volumes low to ensure freshness for Sunday's 5-hour hike, which serves as the key endurance test. The gym sessions focus on mobility and neural activation rather than heavy loading to protect your back.

Today's workout

Today — 2026-10-26

Title	Hip Mobility & Core Activation
Type / intensity	workout / easy
Duration	45 min
Status	planned

DESCRIPTION

Focus on opening tight hips and activating glutes to protect the lower back. 10 min dynamic warm-up (cat-cow, bird-dog, leg swings). 3x10 World's Greatest Stretch per side. 3x12 Glute Bridges (hold top 2s). 3x30s Dead Bug (slow control). 5 min static stretching (pigeon pose, hamstring stretch with strap). Keep intensity low; focus on range of motion, not strength.

RATIONALE

This session addresses your primary mechanical limitation: poor hip flexibility and weak posterior chain activation, which directly cause your back pain and upright cycling posture. By prioritizing mobility today, we create the structural capacity to handle the vault technique work later in the week and reduce injury risk during Sunday's long hike.

OPTIONALITY

Skipping this session leaves your hips tight and your back vulnerable. Given your history of back injury and the upcoming 5-hour hike, this maintenance work is non-negotiable for pain-free movement.

ALTERNATIVES

- Gym-based mobility circuit using foam roller and lacrosse ball for myofascial release.

PLAN 9 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Inception Mercury 3

inception/mercury-3

Full plan	51.7 s / $0.0120
Week + day refresh	18.4 s / $0.0051
Total	**70.1 s / $0.0171**

Season

2026-10-26 → 2027-08-22

GOAL

Fat loss to 15% body fat, improved hip flexibility and core/back strength, and successful completion of the 200 km brevet in April 2027 with solid general cycling fitness for longer tour races, culminating in Paris-Brest-Paris in August 2027.

RATIONALE

The season is divided into phases that respect the athlete's training history, preferences, and realistic capacity for disciplined training. The athlete has shown he maintains disciplined training for at most 4 months, so the plan builds a broad base of aerobic fitness, strength, and fat loss through the winter using low-intensity, habit-focused work that is sustainable and enjoyable, including indoor cycling, rowing, running, hiking, and strength training. As spring approaches and outdoor road cycling becomes possible, the plan gradually shifts to more specific endurance and race-oriented training, with a focused build block leading into the 200 km brevet in April. Following the brevet, the athlete maintains fitness through a lighter maintenance period before a final specialized build for Paris-Brest-Paris in August, with a proper taper. The early emphasis on fat loss and strength is critical because the athlete's primary goal is fat loss, and his back and hip limitations require careful posterior-chain loading and mobility work to prevent injury during long rides. The training is designed to be time-efficient, with weekday sessions capped at 2 hours and longer weekend rides/hikes, and uses power targets for cycling and HR targets for other activities, while strength training is gym-based and specific. The plan avoids unnecessary volume and intensity, ensuring each workout counts, and builds in flexibility for winter conditions (cross-country skiing, snowshoeing, fatbike) to maintain aerobic fitness without resorting to road cycling in poor conditions.

First block

2026-10-26 → 2027-01-03

Rebuild & Fat Loss Foundation

FOCUS

Establish consistent training habits, easy aerobic base, strength and mobility, fat loss. Includes vault-specific prep for Jan 7 championship in later weeks.

RATIONALE

The block is revised to reflect the athlete's new pole vault world championship on January 7, 2027, which falls in week 10 of this block. The original block had no vault-specific work, so we are adding a progressive vault preparation track starting from week 5. Also, the athlete completed week 1 well (gym + trainer ride) but missed Sunday's run/walk and added an unplanned long hike, so week 2 is kept very easy to ensure recovery before the 5-hour hike on Nov 1. The overall block remains focused on habit building, easy aerobic base, and fat loss, but now includes a gradual introduction of sprint/plyo work and posterior-chain loading to support vaulting, while respecting the athlete's back injury history.

First week

Week starting 2026-10-26

FOCUS

Habit formation and very easy aerobic base

RATIONALE

This is the second week of the Rebuild & Fat Loss Foundation block. You completed your gym session and easy trainer ride in week 1, but you also added an unplanned long hike (11 km, 608 m elevation) and a 60-minute trainer ride on a rest day. To recover from that hike and protect the planned 5-hour hike on Sunday, this week is kept genuinely easy and short. The week includes one full rest day today, a short flat walk, an easy trainer ride, a light gym session, a rest day, a very easy indoor ride, and the long hike on Sunday. This structure balances recovery with habit formation and keeps you fresh for the weekend's aerobic base effort.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest & Hip Mobility** — Full rest day. Perform 15-20 min of hip mobility and light stretching (hip flexors, glutes, hamstrings, lower back). Keep it relaxed; no elevated heart rate.

Title	Easy Flat Walk
Type / intensity	workout / easy
Duration	30 min
Status	planned

DESCRIPTION

30-minute flat walk outdoors, keeping HR under 120. No hiking, no climbs. Purpose is recovery and movement, not training stimulus.

RATIONALE

This walk is a recovery tool: it promotes blood flow to the legs, flushes out stiffness from Sunday's hike, and reinforces the habit of daily movement without adding any training load. It prepares your body for the upcoming week's aerobic base work. Skipping it would leave you sedentary on a recovery day, but the cost is small since the stimulus is minimal; the bigger benefit is habit consistency.

OPTIONALITY

The walk is intentionally very short and easy. Its main purpose is recovery and habit, not fitness. If you feel unusually tired or tight, you can replace it with 15 minutes of mobility or simply rest.

ALTERNATIVES

- 20-min indoor bike at very easy pace
- 10-min rowing machine at easy pace

PLAN 10 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Moonshot Kimi K3.1 Pro

moonshotai/kimi-k3.1-pro

Full plan	267.9 s / $0.1757
Week + day refresh	171.1 s / $0.1230
Total	**439.0 s / $0.2987**

Season

2026-10-26 → 2027-08-22

GOAL

Reach Paris-Brest-Paris in August 2027 healthy and prepared to finish strongly, comfortably complete the 2027 randonneur brevet series beginning with the April 200 km, improve general cycling and longer-race fitness, reduce body fat gradually toward 15%, and develop back-safe strength, hip mobility, running, and rowing.

RATIONALE

The season begins with a conservative rebuild because current fitness is detrained and recent training has been inconsistent. Easy aerobic work, technique-based gym lifting, hip mobility, and a modest sustainable energy deficit establish tolerance without chasing rapid weight loss or early intensity. The January 7 pole-vault championship requires a short, carefully controlled specialization and taper, with explosive work introduced only as back and tendon tolerance permit. Winter then provides a low-pressure aerobic and strength base using skiing, snowshoeing, fatbiking, indoor cycling, hiking, beginner running, and beginner rowing. Spring progressively transfers fitness to outdoor cycling and prepares for the April 200 km without starting an unsustainably long disciplined build. The final 17 weeks form the focused PBP campaign: general endurance and threshold support first, then long-ride, brevet, climbing, fueling, and overnight-endurance specialization, followed by a two-week taper and race week. This delays the most demanding training until within the athlete's roughly four-month productive window while retaining enough year-round activity to preserve the base.

First block

2026-10-26 → 2026-11-29

Rebuild and Fat-Loss Foundation

FOCUS

Restore consistent training with steady aerobic work, two progressive back-safe full-body gym sessions weekly, daily hip and hamstring mobility, beginner rowing and running, and sustainable fat-loss habits.

RATIONALE

The five-week structure and dates remain appropriate, but the opening week is explicitly recovery-led because the unplanned 24 October ride and 25 October mountain hike added substantial load. The successful 23 October ride confirms that steady, surge-free cycling is well tolerated, while the first gym session supports cautious progression to three goblet-squat sets and light Romanian deadlifts without rushing posterior-chain loading. Running is withheld until after the 1 November hike, and no extra endurance session is added to compensate for missed or changed workouts. Weeks 2-4 restore aerobic volume, lifting technique, rowing skill, and impact tolerance gradually; week 5 remains a deload. The January pole-vault championship will be addressed in the following specialization block rather than by prematurely adding explosive work now. Fat loss remains gradual through repeatable meal and evening-snack routines, with performance, recovery, and back symptoms taking precedence over rapid weight change.

First week

Week starting 2026-10-26

FOCUS

Recovery-led re-entry with two steady trainer rides, two technique-first gym sessions, daily hip mobility, and a comfortable five-hour hike on Sunday.

RATIONALE

The extra 60-minute ride on 24 October and demanding 11.1 km mountain hike on 25 October make recovery the priority at the start of this week. Two short, perfectly steady rides maintain the aerobic rebuilding process without adding intensity, while two gym sessions cautiously progress goblet squats and introduce light Romanian deadlifts only with a comfortable hip hinge and a calm back. Running remains withheld, mobility is increased to a useful daily dose, and Sunday's hike is capped at five hours rather than treated as a target to force. The resulting load is approximately 8-8.5 hours including the hike. Fat loss continues through regular meals, a planned after-work meal, adequate protein, and a deliberate evening snack rather than compensatory restriction or extra exercise.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Recovery and hip mobility** — Take a full training rest after the extra weekend load. Complete 10-15 minutes of gentle hip-flexor, hamstring, adductor, and thoracic mobility without forcing range. An optional short, flat walk is fine if it helps loosen the legs. Eat normally rather than restricting food to compensate for the weekend.

Title	Very easy steady trainer ride
Type / intensity	workout / easy
Duration	45 min
Status	planned

DESCRIPTION

Ride 45 minutes indoors: 10 minutes easy warm-up, 30 minutes perfectly steady at 140-150 W with cadence 85-95 rpm, then 5 minutes easy. Aim for HR approximately 115-135 bpm with no surges or intervals. Reduce power immediately if HR rises above 135 bpm or hiking fatigue remains obvious. Finish with 10 minutes of hip-flexor, hamstring, and thoracic mobility.

RATIONALE

This short ride restores controlled aerobic training without interfering with recovery from the weekend or Wednesday's strength session. The flat power target practices the steady, economical pacing needed for long-distance cycling while keeping the week's non-hiking load deliberately low.

OPTIONALITY

The session rebuilds the aerobic efficiency and surge-free pacing that will support comfortable brevet riding and gradual fat loss. Skipping it removes one of only two planned cycling stimuli in this recovery-led week and delays the return to consistent aerobic training, although no extra endurance volume should be added elsewhere to compensate.

ALTERNATIVES

- If your legs remain heavy, shorten the steady portion to 20 minutes at 130-140 W; if fatigue or back soreness is significant, take another rest day instead.

Week + day refresh	17.5 s / $0.0069
Total	**46.3 s / $0.0176**

Season

2026-10-26 → 2027-08-15

GOAL

Build toward Paris-Brest-Paris in August 2027, with a strong 200 km brevet in April 2027, improved general cycling fitness for longer road races, gradual fat loss from 24.5% to approximately 15% body fat, better hip mobility and back resilience, and foundational running, rowing, and strength training while preparing for the pole-vault world championship on 2027-01-07.

RATIONALE

The athlete is returning after substantial detraining but retains a strong endurance history, including a successful 1130 km bikepacking race. The season therefore begins with a short, low-stress rebuild that establishes consistency, protects the back, and supports gradual fat loss without creating the overtraining pattern the athlete has previously experienced. The January pole-vault championship is treated as a distinct priority, with a brief strength-and-sprint preparation and taper, followed by recovery and a renewed aerobic base. Winter training uses indoor cycling, fatbike riding, cross-country skiing, snowshoeing, hiking, rowing, and gym work to maintain fitness while road conditions deteriorate. The spring build progressively increases volume and introduces controlled intensity, culminating in the April 200 km brevet. The final eight-week block develops race-specific endurance and climbing power, followed by a three-week taper for Paris-Brest-Paris. All blocks are contiguous, with no unnecessary high-intensity volume before the athlete is physiologically and technically prepared for it.

First block

2026-10-26 → 2026-11-29

Rebuild and Fat-Loss Foundation

FOCUS

Re-establish consistent, low-stress aerobic training, short run-walk work, hiking, and technique-first gym training while protecting back and hip health, establishing sustainable fat-loss habits, and beginning a measured transition toward pole-vault preparation

RATIONALE

The athlete is returning after substantial detraining and has shown that consistency, not intensity, is the main limitation. The block therefore keeps most aerobic work easy and controlled, progresses duration gradually, and uses strength work to improve posterior-chain resilience and hip mobility without provoking the athlete's back problems. The 1 November hike is retained as a controlled aerobic checkpoint, while the 2027 pole-vault world championship adds a need for short sprint exposures, plyometrics, technical vault work, and careful posterior-chain loading. These elements are introduced gradually and kept low-volume so they support the later preparation block without undermining aerobic rebuilding or recreating the athlete's previous pattern of early burnout. Nutrition, sleep, hunger management, and daily walking remain important supporting behaviors throughout.

First week

Week starting 2026-10-26

FOCUS

Recovery-aware re-entry with controlled aerobic work, back-safe strength, short run-walk work, and the planned 5-hour hike

RATIONALE

The 25 October mountain hike was substantially harder than the planned easy run-walk, so the first two days are deliberately light rather than adding intensity. The week retains the 1 November 5-hour hike as the main aerobic checkpoint, but keeps the surrounding cycling, running, and gym work easy and technically controlled. This protects the back and hips, supports fat-loss habits through regular movement, and avoids repeating the surge-recover pattern from the recent spinning classes. Short, low-volume vault preparation will be introduced gradually in the following weeks, with the main pole-vault emphasis beginning in the dedicated preparation block.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Recovery and hip mobility** — No structured workout. Complete 20 minutes of gentle mobility only: seated hip-flexor and hamstring stretches, thoracic rotations, and easy walking. Keep the effort easy and stop if the back or hips become painful.

Title	Easy indoor aerobic ride
Type / intensity	workout / easy
Duration	45 min
Status	planned

DESCRIPTION

Indoor bike with a 10-minute easy warm-up, then 30 minutes of steady riding at 120-140 W and HR 115-135 bpm, followed by a 5-10-minute cool-down. Keep cadence comfortable and avoid surges. If the legs feel heavy after Sunday's hike, reduce the main block to 20-25 minutes.

RATIONALE

This short, controlled ride rebuilds the aerobic rhythm needed for the 5-hour hike without adding a hard stimulus. It supports the block's goal of consistent easy training and fat loss, while the steady power target trains the sustainable pacing discipline needed for long rides and the April 200 km brevet. Skipping it would remove one of the week's key opportunities to establish repeatable aerobic volume without compromising recovery.

OPTIONALITY

The cost of skipping is meaningful because this session builds the steady aerobic durability and repeatable training habit that carry you through long hikes, the April 200 km brevet, and eventually Paris-Brest-Paris; it is not merely filler volume.

ALTERNATIVES

- If fatigue is noticeable, replace the ride with a 25-30 minute flat walk and complete the mobility routine.
- If the legs feel fresh and there is no back or hip pain, extend the steady block by no more than 10 minutes.

PLAN 13 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Google Gemini 4 Argon

google/gemini-4-argon

Full plan	143.1 s / $0.1653
Week + day refresh	82.8 s / $0.1034
Total	**225.9 s / $0.2688**

Season

2026-10-26 → 2027-08-29

GOAL

Achieve sustainable fat loss from 24.5% toward 15% body fat, resolve hip mobility and lower-back durability limitations through progressive gym strength training, prepare safely for the January 7 Pole Vault World Championship, and build cycling fitness to complete the 2027 spring/summer brevet qualifiers (starting with a 200 km in April), competitive tour races, and Paris-Brest-Paris (1200 km) in August 2027.

RATIONALE

Because you historically sustain strict, disciplined training for a maximum of 3–4 months before burning out, the overarching strategy reserves high-discipline, structured cycling intervals and brevet-specific volume for the March–August 2027 window. However, with the newly added Pole Vault World Championship on January 7, 2027, the autumn and early winter are split into two focused phases: first, a 6-week anatomical adaptation, fat-loss habit, and running/rowing foundation block that safely prepares your lower back and hips for explosive loading; second, a 5-week vault-specific power, sprint conditioning, and technical taper block through early January. Once the vault championship concludes, January and February shift to low-stress Norwegian winter cross-training (cross-country skiing, snowshoeing, fatbiking, and indoor rowing) paired with heavy gym strength and steady caloric deficit to drive fat loss and aerobic base without mental fatigue. In March, as tarmac opens, we launch the disciplined 4-month cycling build: progressing FTP from ~220 W back toward 280+ W for the April 200 km brevet, expanding endurance through the May/June 300/400/600 km qualifiers and tour races, taking a brief mental and physical reset in July to prevent stagnation, and executing a final ultra-distance sharpening and taper for Paris-Brest-Paris in August.

First block

2026-10-26 → 2026-12-06

Rebuild, Hip Mobility & Vault Conditioning Base

FOCUS

Establish sustainable fat-loss nutrition habits, progressive lower-back and hip-hinge strength in the gym, daily hip flexibility work, steady Zone 2 aerobic base (indoor cycling, hiking, beginner rowing), and a gradual return-to-running progression to prepare tendons and musculature for sprint and pole vault loading.

RATIONALE

Following your unplanned 2h45 Sunday hike on October 25 and Saturday's extra 60-minute ride, this 6-week block begins by managing immediate lower-body fatigue early in Week 1 so you can safely complete your 5-hour hike on November 1 while introducing light Romanian deadlifts and a third goblet squat set (12 kg) in the gym. Because the January 7 Pole Vault World Championship requires high-velocity running and explosive takeoffs—which pose a direct risk to your sensitive lower back and tight hips—we use these six weeks to systematically build posterior-chain durability, core anti-extension strength, daily hip mobility (10–15 minutes per day, up from last week's 2.5 minutes), and tendon resilience. Running progresses

carefully from easy run/walk intervals to short, controlled neuromuscular strides, while steady Zone 2 cycling (140–160 W), beginner indoor rowing, and weekend hikes/winter outings provide low-stress caloric expenditure to drive fat loss without triggering the mental burnout of premature cycling interval discipline.

First week

Week starting 2026-10-26

FOCUS

Absorb fatigue from Sunday's 2h45 hike with an easy start to the week, introduce light Romanian deadlifts and a 3rd goblet squat set (12 kg) in the gym, expand hip flexibility work to 10+ minutes per session, hold a flat 140–150 W line on the indoor trainer, and arrive fresh for Sunday's 5-hour mountain hike.

RATIONALE

Because you replaced last Sunday's planned 30-minute run/walk with a demanding 2h45 mountain hike (608 m climbing, HR into the 160s) on top of back-to-back indoor rides on Friday and Saturday, your legs carry much more muscular fatigue into this week than originally planned. To protect your lower back and ensure you are fresh for Sunday's 5-hour hike on November 1, Monday is set as a complete rest day (with daily hip mobility) and the delayed 30-minute run/walk is placed on Tuesday as an optional/convertible session depending on leg freshness. In the gym on Wednesday and Friday, we build directly on last Thursday's feedback: adding the third set of 12 kg goblet squats, introducing very light Romanian deadlifts (RDLs) with a strict hip hinge to safely prepare your posterior chain for both cycling posture and your newly announced January 7 Pole Vault World Championship, and extending post-workout stretching from 2.5 minutes to a dedicated 10–12 minutes. Thursday's indoor ride nudges your steady target up slightly to 140–150 W while keeping the same flat, surge-free heart rate line (120–138 bpm) you executed so well on October 23 and 24. Saturday is a full rest day so you can execute Sunday's 5-hour hike with disciplined pacing and stop control. For your fat-loss goal this week, combat the post-work hunger trap by drinking a large glass of water and eating a high-protein, high-fiber snack 30 minutes before leaving work, and brush your teeth immediately after dinner to create a clear mental barrier against late-evening kitchen snacking.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest Day & Hip Mobility Reset** — Full rest from aerobic and strength training to absorb yesterday's 2h45 Selbu mountain hike (608 m climbing) and Saturday's extra 60-minute indoor ride. Spend 10–15 minutes in the evening on gentle, unloaded hip and lower-back mobility: 2x60s per side kneeling hip-flexor (couch) stretch with posterior pelvic tilt, 2x60s per side supine figure-4 piriformis stretch, and 10 slow cat-cow spinal articulations. Nutrition focus: eat a protein-rich snack (such as skyr/quark or a handful of almonds and an apple) 30 minutes before leaving work so you do not arrive home ravenous.

Title	Easy Run/Walk Tendon Conditioning & Hip Mobility
Type / intensity	workout / easy
Duration	40 min
Status	planned

DESCRIPTION

Make-up session for last Sunday's missed run/walk—perform this as a run/walk ONLY if your legs and lower back feel completely fresh after Sunday's hike; if your quads or calves are still sore, convert this to a brisk 30-minute flat walk. Protocol: 5 min brisk walk warm-up, then 5 rounds of (3 min very easy jog / 1 min walk), finishing with a 5 min walk cool-down. Focus on a light, quick cadence to begin conditioning your Achilles and patellar tendons for pole vault approach runs. Keep HR strictly below 140 bpm (ideally 120–135 bpm) and wear your headlamp if heading out after work. Follow immediately with 10 minutes of hip flexor, hamstring (strap-assisted supine stretch keeping lower back flat on the floor), and glute stretching.

RATIONALE

With the January 7 Pole Vault World Championship on your calendar alongside your beginner running goal, we need to start conditioning your lower-leg tendons and impact tolerance early in the block. Placing this short, low-heart-rate run/walk on Tuesday gives you 48 hours of recovery after Sunday's hike and sets up Wednesday's gym session without adding deep muscular fatigue.

OPTIONALITY

This session builds initial Achilles, calf, and patellar tendon stiffness required to safely handle sprint approach velocities for the January 7 Pole Vault World Championship and progresses your beginner running foundation. Skipping it delays your running tendon adaptation by several days, which is an acceptable trade-off today ONLY if your legs or lower back are still sore from Sunday's unplanned 2h45 mountain hike—protecting your back for Wednesday's gym hinge work and Sunday's 5-hour hike comes first.

ALTERNATIVES

- 30-minute brisk flat walk (HR < 120 bpm) followed by 10 minutes of hip and hamstring mobility if your legs still feel heavy from Sunday's hike
- Same 40-minute run/walk protocol on an indoor treadmill (1% incline) if you prefer staying indoors

PLAN 14 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

OpenAI GPT-6.1 Sol Pro

openai/gpt-6.1-sol-pro

Full plan	222.8 s / $0.4945
Week + day refresh	102.5 s / $0.2712
Total	**325.3 s / $0.7658**

Season

2026-10-26 → 2027-08-26

GOAL

Achieve gradual fat loss, improve back-tolerant strength and hip mobility, prepare safely for the reported 7 January pole-vault championship, complete the 2027 brevet qualification series comfortably, and finish Paris-Brest-Paris strongly while maintaining fitness for longer cycling races.

RATIONALE

Recent steady rides and substantial hikes indicate retained endurance, but inconsistent training and sensitivity to light strength work favor gradual rebuilding. Flexible winter training supports adherence without demanding continuous peak-focused discipline. Focused preparation for January, spring qualification and Paris-Brest-Paris is separated by recovery and variety. Confirm the pole-vault event and arrange qualified technical coaching before introducing explosive training. Most endurance work remains conversational, with purposeful intensity added progressively and easier weeks approximately every third or fourth week. Pursue fat loss through modest portion changes, a planned protein-rich afternoon snack and approximately 1.6–2.0 g/kg/day protein, while fueling demanding sessions and avoiding energy restriction around competitions. Brevet dates and the August event window remain provisional pending confirmation. Week counts are whole weeks rounded up for partial blocks; dates define exact coverage.

First block

2026-10-26 → 2026-11-08

Recovery and sustainable re-entry

FOCUS

Recover from the 25 October hike, rebuild a manageable easy-training routine, and establish back-tolerant gym strength and hip mobility without adding unnecessary intensity.

RATIONALE

Retain the two-week recovery block rather than accelerating into vault-specific or cycling intensity work. The latest activity record supersedes the earlier review: Sunday included a substantial hike and Saturday added an easy ride. Strength tolerance remains limited despite retained cycling endurance, so the previous suggestion to add a third 12 kg squat set and Romanian deadlifts is deferred. Count mobility, warm-ups and alternative sports within total load. Progress only with normal sleep, manageable soreness and no worsening back symptoms. Confirm the January event details and arrange qualified vault coaching before adding sprinting, jumping or technical practice; any assessment replaces another session. Support gradual fat loss with approximately 145–180 g protein daily, a planned afternoon snack and modest portion changes, while fueling longer activity.

First week

Week starting 2026-10-26

FOCUS

Recover from the mountain hike, restore easy cycling consistency and establish tolerable strength without adding intensity.

RATIONALE

The latest activity record supersedes the earlier review: Sunday included a substantial hike, and Saturday added approximately 60 minutes of cycling. Begin with rest and an optional recovery exposure, then use two easy rides, two small strength exposures and a shortened Sunday hike. The scheduled maximum is 265 minutes including warm-ups and mobility, not a quota. Cycling maintains sport-specific aerobic efficiency; gym work establishes strength and trunk endurance for prolonged riding posture; hiking supplies easy endurance without repeating last weekend's load. Remove Saturday strength or shorten Sunday if recovery is incomplete. Defer running, rowing, loaded hinges and explosive work. Confirm the January event and obtain qualified vault coaching before adding technical or power training. Support gradual fat loss with a planned protein-rich afternoon snack, approximately 145–180 g protein daily and modest portion changes rather than underfueling training.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Recover from Sunday's mountain hike** — No structured training. Sunday's 165-minute hike with 608 m climbing followed Saturday's approximately 60-minute easy ride. Do not make up the run/walk or add lifting. Prioritize sleep, regular meals and hydration; assess leg soreness, stair descent and back comfort.

Title	Gentle recovery walk and hip mobility
Type / intensity	workout / easy
Duration	20 min
Status	planned

DESCRIPTION

If soreness is improving and walking is normal, walk 15 minutes on flat ground at RPE 1–2/10, generally below 125 bpm without chasing a heart-rate target. Follow with 5 minutes of comfortable hip rotations and gentle hip-flexor stretches. Avoid forced hamstring stretching or rounding the lower back. Replace with rest if fatigue remains pronounced or walking alters your gait.

RATIONALE

This provides a low-load return to comfortable movement and a readiness check before Wednesday's ride, without trying to recover missed endurance training.

OPTIONALITY

Walking and gentle hip movement maintain comfortable movement range and the sustainable activity routine supporting fat loss and long-distance cycling. Within this approximately four-hour recovery week, skipping costs only a small movement and mobility exposure, not meaningful endurance fitness. That cost is acceptable if additional recovery improves subsequent cycling and strength work.

ALTERNATIVES

- Complete rest if legs remain sore, fatigue is pronounced or back symptoms worsen.

PLAN 15 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

OpenAI GPT-6.1 Sol

openai/gpt-6.1-sol

Full plan	210.3 s / $0.2051
Week + day refresh	101.8 s / $0.1278
Total	**312.1 s / $0.3330**

Season

2026-10-26 → 2027-08-26

GOAL

Prioritize gradual fat loss and back-resilient strength while preparing safely for the reported pole vault competition on 2027-01-07, comfortably completing the 2027 randonneur qualifying series beginning with a 200 km brevet in April, and finishing Paris-Brest-Paris strongly in August 2027. Develop cycling fitness for occasional longer road races.

RATIONALE

Recent steady rides and substantial hikes indicate retained endurance, but inconsistent training, limited initial strength tolerance and recurrent back symptoms favor a conservative restart. Begin with recovery from the October 25 hike and build enjoyable, mostly easy multisport consistency. Confirm the January pole vault event, experience level and qualified technical supervision before introducing explosive training. After January, use two focused cycling builds separated by recovery rather than demanding uninterrupted discipline through August. Most endurance work remains conversational; progressively introduced threshold and aerobic-power training supports both brevets and longer races. Brevets replace other long rides rather than adding to them. Reduce load approximately every third or fourth week and after events, guided by fatigue and symptoms. Initially target approximately 5–7 total training hours weekly, progressing toward 7–10 through winter and 9–13 in cycling-focused periods if recovery permits; brevet weeks are exceptions, not new baselines. Support slow fat loss with protein-rich meals, a planned afternoon snack, portion structure and reduced snack availability rather than mandatory calorie tracking. Avoid energy restriction around demanding sessions and events. Approximately 1.6–2.0 g/kg/day protein and progressive strength training support lean-mass retention. Use 220 W as a provisional cycling FTP, reassessed after consistent training; early easy cycling can be approximately 120–155 W, adjusted to conversational effort. Heart-rate guidance for other sports must remain provisional and sport-specific. Paris-Brest-Paris is provisionally represented as August 22–26; confirm official dates, qualifying deadlines and local brevet dates before final scheduling. Week counts are whole planning weeks, with the final block including a partial third week.

First block

2026-10-26 → 2026-11-15

Recovery and sustainable re-entry

FOCUS

Recover from the October 25 hike, establish an enjoyable 5–7-hour multisport routine, and introduce conservative gym training, hip mobility and trunk endurance without aggravating the back. Confirm the January pole vault competition and access to qualified coaching before introducing explosive work.

RATIONALE

Keep the existing block dates and recovery-first purpose. Actual weekend training was larger than the earlier weekly summary captured, while the first gym session showed limited tolerance for squat volume. Consequently, shorten the November 1 hike, retain low-volume supported strength work and defer running

until recovery is demonstrated. Do not implement the earlier automatic squat-set, Romanian-deadlift or sprint progression. Progress duration and technique before intensity, with at least 48 hours between gym sessions and one full rest day weekly. Seek physiotherapy assessment for recurrent back symptoms; sharp, radiating or progressively worsening pain warrants stopping and assessment. Confirm the January event and technical supervision without changing the season plan. For gradual fat loss, use approximately 145–180 g protein daily, a planned afternoon snack and structured portions; aim for a slow weight trend around 0.2–0.4 kg weekly without restricting fuel around demanding outings.

First week

Week starting 2026-10-26

FOCUS

Recover from the weekend load, restore back-tolerant strength practice, and maintain easy endurance without accumulating fatigue.

RATIONALE

The October 24 ride and October 25 hike supersede the earlier review's incomplete account. Sunday's hike contributed approximately 165 moving minutes; elapsed time and activity comments are not additional training. Schedule a reduced 215-minute week including mobility, with two initial low-load days, two conservative gym exposures at least 48 hours apart, one steady ride and one shortened hike. Strength supports lean-mass retention during gradual fat loss and trunk endurance for long rides; cycling preserves sport-specific aerobic conditioning; hiking supplies recoverable aerobic time on feet. No running, loaded hinges, intervals or explosive work this week. Cancel rather than make up sessions if recovery lags. Confirm the January 7 vault event, experience and qualified supervision before adding vault preparation. Use regular protein-rich meals and a planned afternoon snack rather than underfueling exercise. Seek physiotherapy assessment for recurrent back symptoms; stop and seek assessment for sharp, radiating or worsening pain.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Recover from Sunday's mountain hike** — No structured training after Sunday's 165-minute hike with 608 m of climbing. Prioritize sleep, normal meals and hydration. Gentle, comfortable hip movements are fine; avoid forceful stretching. Assess walking, stairs and back comfort before resuming exercise.

Title	Gentle recovery walk and hip mobility
Type / intensity	workout / easy
Duration	20 min
Status	planned

DESCRIPTION

Walk on flat ground for 15 minutes at RPE 1–2/10, with provisional HR below 120 bpm and no minimum target. Finish with 5 minutes of gentle supported hip rotations, hip-flexor stretching and comfortable hamstring mobility. Use lights and reflective clothing after dark. Rest instead if walking alters your gait or increases soreness or back discomfort.

RATIONALE

This low-load movement exposure checks recovery before Wednesday's gym session and maintains comfortable hip movement without adding substantial fatigue. It is not intended to build endurance or compensate for missed training.

OPTIONALITY

Walking and mobility support movement tolerance and hip range for comfortable long-distance cycling and this block's return to strength training. Within this reduced 215-minute week, skipping loses only a small mobility and movement exposure, not meaningful aerobic fitness. That cost is acceptable if another recovery day improves readiness for purposeful strength and endurance work.

ALTERNATIVES

- Rest completely if soreness, fatigue or back discomfort remains significant.

PLAN 16 OF 16 · 2026-10-25T22-50-13-000Z-INITIAL-16-MODEL

Z.ai GLM-5.3 Prime

z-ai/glm-5.3-prime

Full plan	69.1 s / $0.1374
Week + day refresh	55.0 s / $0.1068
Total	**124.1 s / $0.2442**

Season

2026-10-26 → 2027-08-23

GOAL

Finish Paris-Brest-Paris in August 2027, preceded by completing a randonneur brevet series starting with a 200 km brevet in April 2027, while also competing in the pole vault world championship on 7 January 2027 and reducing body fat from 24.5% to 15%.

RATIONALE

The season is anchored on PBP in August 2027, with two intermediate peaks: the pole vault world championship on 7 January 2027 and the April brevet series. Because you can only sustain disciplined training for about 4 months at a time, the plan deliberately alternates focused blocks with maintenance phases rather than one long linear ramp. The first phase rebuilds your detrained base with easy, surge-free aerobic work, back-safe strength, hip mobility, and fat-loss habits — this also builds the posterior-chain strength needed to safely load for vaulting. A short vault-specific block with a taper into 7 January follows, since explosive power and sprint conditioning cannot be developed in the current easy rebuild. After the vault championship we return to the aerobic rebuild through the Norwegian winter, using fatbike, studded-tire riding, cross-country skiing, snowshoeing, and indoor trainer ERG intervals, plus the beginner run and rowing programs. From roughly March, when tarmac riding resumes, we enter a disciplined ~4-month build toward the April 200 km brevet and the rest of the brevet series, with indoor intervals, tempo work, and progressively longer endurance rides. A final specialization block targets PBP-specific demands (back-to-back long rides, night riding, climbing endurance), followed by a short taper. Fat loss proceeds slowly and steadily throughout via dinner and evening-snack control, which also improves your power-to-weight ratio for the hilly brevets and PBP.

First block

2026-10-26 → 2026-12-20

Rebuild, Fat Loss & Vault Foundation

FOCUS

Re-establish easy aerobic base with steady indoor rides, hikes and winter cross-training; back-safe strength progression (goblet squats, RDLs, hip hinge) and hip mobility; fat-loss habits; transition in December toward vault-specific power, sprint and plyometric work ahead of the 7 January pole vault world championship.

RATIONALE

The block structure is unchanged: a gradual surge-free aerobic re-entry with back-safe strength, transitioning in December to vault-specific power work with a taper into the Vault Specialization block starting 21 December. The only adjustment is that week 1 (26 October) now starts after an unplanned 3h20 mountain hike on 25 October, so this week is kept very light (one gym session, two short steady rides, rest days) to arrive fresh for the 1 November 5-hour hike, and week 2 remains a genuine recovery week. The January 7 pole vault championship is now the near-term priority event, so the December weeks

emphasize sprint, plyometric and technical vault preparation built on the posterior-chain strength developed in November, while fat loss continues via dinner and evening-snack control.

First week

Week starting 2026-10-26

FOCUS

Re-entry and recovery: stay easy after Sunday's 3h20 hike, complete gym session 2 with Romanian deadlifts, and arrive fresh for the 5-hour hike on 1 November.

RATIONALE

Sunday's mountain hike was far more than the planned light close, so this week stays genuinely easy to absorb it and be fresh for the 5-hour hike on 1 November. Only two short steady trainer rides and one gym session serve as training stimuli; rest days and hip mobility fill the rest. The gym session adds the third goblet squat set at 12 kg and introduces light Romanian deadlifts with a strict hip hinge — the posterior-chain foundation needed for vault loading in December — plus 12-15 minutes of stretching to actually move the needle on those hips. Trainer rides target 140-150 W with a flat HR line under 145. Fat-loss focus stays on dinner portion control and avoiding evening snacks, especially important this week since activity is low.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest day with hip mobility** — Full rest after Sunday's 3h20 mountain hike. Do 15 minutes of hip mobility: couch stretch 2x60s/side, 90/90 hip rotations 2x10/side, standing toe-touch progression (bent-knee to straight-knee) 2x10, supine hamstring stretch with strap 2x45s/side. Keep dinner moderate and skip evening snacks.

Title	Easy trainer ride, steady 140-150 W
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

10 min warm-up at 90-110 W, then 40 min perfectly steady at 140-150 W in ERG mode, cadence 85-95, HR must stay under 145 — if it drifts above, back off immediately, no surges. 5 min cool-down. Finish with 10 minutes of hip stretching.

RATIONALE

A short, surge-free aerobic stimulus that re-establishes the steady-effort pattern we're rebuilding after the erratic 15 October spinning classes, without adding meaningful fatigue before Sunday's 5-hour hike.

OPTIONALITY

This session rebuilds the aerobic base and flat-effort discipline that carries you through the April 200 km brevet and PBP — the exact pattern that failed (surge-recover) on 15 October. Skipping it loses one of only two aerobic stimuli this week, slowing the rebuild of your detrained base toward the 220 W-plus fitness needed before the winter block.

ALTERNATIVES

- If the trainer is unavailable, an easy 60-minute fatbike ride at conversational effort, HR under 145.

Total	**234.7 s / $0.2613**

Season

2026-10-26 → 2027-08-22

GOAL

Achieve sustainable fat loss (24.5% down toward 15% body fat), resolve hip mobility and lower-back durability limitations through progressive gym strength, compete safely in the January 7 Pole Vault event, complete the spring/summer 2027 Randonneur Brevet qualifiers (starting with 200 km in April), and peak for Paris-Brest-Paris (1200 km) in August 2027 while restoring FTP >280 W for long tour races.

RATIONALE

Because you historically experience burnout after ~4 months of strict, disciplined cycling training, this 43-week season holds back structured cycling intensity until spring 2027. The autumn and winter phases prioritize your primary goals of steady fat loss, posterior-chain/core rehabilitation, and multi-sport cross-training (gym lifting, beginner running, rowing, hiking, XC skiing, and fatbiking). Furthermore, to accommodate your newly announced January 7 Pole Vault competition without triggering your history of back injuries, the late-2026 blocks carefully bridge from foundational hip-hinge stability into explosive power and sprint/approach conditioning, while maintaining low-stress aerobic volume for fat oxidation. Following the January event, the plan shifts into an enjoyable, multi-modal Norwegian winter base before launching a focused, purposeful 16-week disciplined cycling progression in March (when tarmac riding resumes) to carry you through the April 200 km brevet, long tour races, and a peak at Paris-Brest-Paris in August.

First block

2026-10-26 → 2026-11-29

Aerobic Rebuild, Mobility & Strength Foundation

FOCUS

Establish sustainable fat-loss nutrition habits, daily hip-flexor and hamstring mobility, back-safe gym strength (goblet squats, strict RDLs, core anti-rotation), beginner run/walk and indoor rowing technique, and steady Zone 1-2 cycling and mountain hiking.

RATIONALE

Coming off post-July detraining and last week's re-entry sessions (including the unplanned 2h45 Sunday mountain hike and Saturday indoor ride), this 5-week block prioritizes tissue tolerance, postural rehabilitation, and steady fat loss without triggering mental burnout or lower-back flare-ups. Week 1 manages early-week fatigue from the 25 October hike so you arrive fresh for the planned 5-hour mountain hike on 1 November, while systematically progressing your gym foundation (adding the 3rd goblet squat set at 12 kg, introducing strict light RDLs, and expanding hip stretching to 12-15 minutes). Across Weeks 2 to 4, we gently build beginner run/walk resilience and indoor rowing mechanics, maintain flat-power Zone 1-2 cycling (140-160 W), and gradually prepare your posterior chain, ankles, and tendons for the explosive pole vault demands starting in December (leading to the Jan 7 competition), concluding with a Week 5 deload.

First week

Week starting 2026-10-26

FOCUS

Absorb last Sunday's 2h45 hike with an easy start, progress gym session 2 (3x10 goblet squats at 12 kg, light strict RDLs, 12+ min dedicated hip mobility), hold flat 140-150 W indoor cycling, and execute the 5-hour mountain hike on Sunday 1 November.

RATIONALE

Because you replaced last Sunday's short run/walk with a demanding 2h45 mountain hike (608 m climbing) on top of Saturday's unplanned 60-minute indoor ride, your legs enter this week carrying extra muscular load. Monday is kept as a complete rest day with gentle evening mobility so your lower body recovers. Tuesday brings your second gym session, building directly on last Thursday's notes: completing all 3 sets of 12 kg goblet squats, introducing light, strict Romanian deadlifts to safely train the hip hinge for both cycling posture and your January 7 pole vault preparation, and expanding stretching from 2.5 minutes to a dedicated 12-minute routine. Wednesday features the 30-minute beginner run/walk missed last week (to be converted to a brisk walk if your legs still feel heavy), Thursday nudges your flat, surge-free indoor ride up to 140-150 W, and Friday delivers a conservative second strength and mobility session. Saturday is a strict rest day so you arrive completely fresh for Sunday's flagship 5-hour mountain hike. For your fat-loss goal without calorie counting, anchor two simple habits this week: eat a high-protein afternoon snack 60 minutes before finishing work to prevent overeating at dinner, and close the kitchen after dinner with herbal tea.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest & Evening Hip Mobility** — Full rest day from training to absorb yesterday's 2h45 Selbu mountain hike (608 m elevation) and Saturday's extra 60-minute trainer ride. In the evening, spend 10-15 minutes on gentle, unloaded hip mobility at home: 2x60 sec per side couch stretch or half-kneeling hip-flexor stretch (tuck your pelvis under—do not arch your lower back), 2x60 sec supine hamstring strap stretch with a flat lower back, and 10 slow cat-cows. Nutrition focus: start your afternoon pre-dinner protein snack habit today (e.g., skyr or cottage cheese 60 minutes before finishing work) so you do not arrive at dinner overly hungry, and close the kitchen after dinner with herbal tea.

Title	Gym Strength, Hip Mobility #2 & Light Vault Tech
Type / intensity	workout / easy
Duration	55 min
Status	planned

DESCRIPTION

55-minute gym session building directly on last Thursday's baseline. Warm-up (8 min): Easy indoor rowing focused on smooth technique—drive with legs first, hinge back slightly, then pull arms; reverse on recovery. Keep HR strictly <130 bpm (last week crept to 144 bpm). Strength Block (35 min): 1) Goblet Squat: 1 warm-up set of 10 reps at 4 kg, then 3x10 reps at 12 kg (adding the 3rd set you skipped last week; rest 90-120s between sets so quad burn stays manageable). 2) Dumbbell or Barbell Romanian Deadlift (RDL): 3x10 reps with very light load (2x8-10 kg dumbbells or an empty 20 kg bar). Focus 100% on a strict hip hinge: push hips straight back, keep a neutral/flat spine, slight knee bend, and stop the descent mid-shin before your lower back rounds. 3) Glute Bridge: 3x15 reps bodyweight with a 3-second squeeze at the top (progressing from 3x12 which felt easy). 4) Lat Pulldown: 1x12 at 35 kg, then 3x10 at 50 kg (upper-body pulling foundation for pole vault). 5) Core Circuit (3 rounds): Pallof Press 10 reps/side + Front Plank 35 seconds (brace glutes and abs hard). Optional playful pole vaulting technique drills for 10-12 min if desired, keeping takeoff impact conservative. Cool-down Mobility (12 min minimum—up from 2.5 min last week): 2x60s/side half-kneeling hip flexor stretch, 2x60s/side elevated single-leg hamstring stretch (hinge at hips with a flat back), and 2x45s/side figure-4 glute stretch.

RATIONALE

With Monday as a full recovery day after Sunday's Selbu hike, Tuesday is the ideal window to progress your gym foundation. We build directly on last Thursday's feedback by completing the third set of 12 kg goblet squats, introducing very light, strict Romanian deadlifts to teach safe hip-hinge mechanics, maintaining your 50 kg lat pulldowns, and expanding your stretching from 2.5 minutes to a dedicated 12-minute mobility block.

OPTIONALITY

This session builds the posterior-chain motor control, lumbar stability, and hamstring/hip-flexor range of motion needed to rotate your pelvis forward on the bike (relieving sit-bone blisters and climbing back pain for Paris-Brest-Paris) while safely preparing your tendons and back for explosive pole vault training ahead of the January 7 championship. Skipping it delays your structural rehabilitation and leaves your lower back vulnerable as training loads increase.

ALTERNATIVES

- If quads are still noticeably sore from Sunday's hike, keep Goblet Squats at 2x10 @ 12 kg and put full focus on the 3x10 strict light RDLs, upper-body pulling, core, and 15 minutes of mobility.

PLAN 2 OF 7 · 2026-10-26-GEMINI-4-ARGON

Claude Opus 5.5

anthropic/claude-opus-5.5

Full plan	122.5 s / $0.4021
Week + day refresh	63.0 s / $0.2409
Total	**185.5 s / $0.6430**

Season

2026-10-26 → 2027-08-19

GOAL

Finish Paris-Brest-Paris (mid-August 2027) comfortably, after a full randonneur brevet series starting with a 200 km in April and some long tour races. Along the way: compete well at the pole vault world championship on 7 January 2027, lose fat steadily from 24.5% toward 15%, and build hip mobility and a resilient back and core for a lower, more aero riding position.

RATIONALE

The season follows a long-term periodization logic. Aerobic base, tissue tolerance and body composition respond to months of consistent moderate work, while peak cycling form needs only about 3–5 months of focused load. You lost condition after July, so the first block rebuilds habits and easy aerobic volume (mostly zone 2 riding, hiking, skiing and snowshoeing). It also starts the beginner run and row programs and a gym program that loads the back step by step: hinge patterns, RDLs and core anti-movement work, with daily hip mobility. This block is also when fat loss is easiest, because there is no intensity to fuel. The new pole vault championship on 7 January gets a short specific block: sprints, light plyometrics, vault technique and power lifts, while back loading stays conservative. A short taper protects freshness for the event. January and February then form a moderate structured base: ERG sweet-spot and tempo work, long easy winter rides on the fatbike or with studs, and continued strength work that moves from hypertrophy to maximal strength. This keeps the base rising without spending your roughly 4-month window of disciplined motivation too early. The disciplined phase starts in March, when the roads open. Strength shifts to maintenance, while threshold and VO2 intervals lift FTP from about 220 W toward 270–280 W before the 200 km brevet. Brevet distances then grow progressively (200/300, then 400/600), combined with tour races, so durability, fueling, saddle comfort and position adaptations develop in sequence. A deload week absorbs the 600 km load. A 4-week PBP-specific block follows, with back-to-back long days, sleep and pacing practice and fueling rehearsal. A 2–3 week taper then cuts volume while keeping some intensity to arrive fresh. The calorie deficit is moderate in base phases and eases toward maintenance in key race and brevet weeks, to protect performance and recovery.

First block

2026-10-26 → 2026-11-29

Rebuild & Fat Loss Foundation

FOCUS

Rebuild consistent easy aerobic volume with zone 2 trainer rides, hikes and skiing or snowshoeing once snow arrives. Start the beginner run/walk and rowing programs. Gym work twice a week with back-safe progression (goblet squat, RDL hinge technique, Pallof press, planks). Daily hip and hamstring mobility, light pole vault technique, a moderate calorie deficit and evening-hunger habits.

RATIONALE

Progress fits the plan. Your HR stays steady at 120-135 W, and the gym session showed the starting loads: goblet squat at 12 kg with quad burn, lat pulldown up to 50 kg, and an easy plank. Load creep from

unplanned extra sessions (the Saturday ride, the Selbu hike) is the main risk. So week 1 has a recovery start, gym on Tuesday and Friday, and a rest Saturday before the 5 h hike. Your interest in pole vault, with the championship on 7 January, means the light vault touches in weeks 2-4 stay in place and grow a little to prepare for December. Back loading stays conservative. Progression is about 10% per week through week 4, and week 5 is a deload.

First week

Week starting 2026-10-26

FOCUS

Absorb the Selbu hike, settle into routine: 2 gym sessions with RDL intro, first run/walk and row, one steady ERG ride, 5-hour easy hike Sunday, daily hip mobility

RATIONALE

Last week ended with extra volume, so Monday is recovery. Gym sessions on Tuesday and Friday are separated by easy aerobic days. Wednesday starts the run and row programs at minimal doses, so tendons can adapt. Thursday's ERG ride targets 140-150 W, which keeps HR flat. Saturday is rest so you arrive fresh for Sunday's long hike, which builds durability for PBP. There is no extra riding, because unplanned volume is this block's main risk. Every session serves the base, back resilience, mobility or fat loss. Total is about 8 h, all zone 1-2.

Today's workout

Today — 2026-10-26

Title	Recovery walk + hip mobility
Type / intensity	workout / easy
Duration	42 min
Status	planned

DESCRIPTION

30 min flat easy walk, HR <115. Then 12 min hip mobility: 90/90 hip switches 2x8/side, half-kneeling hip flexor stretch 2x45 s/side, supine hamstring strap stretch 2x45 s/side, cat-cow x10, child's pose 60 s. Evening habit: protein snack at 15:30-16:00, a set dinner plate, kitchen closed at 20:30.

RATIONALE

Yesterday's 2h45 Selbu hike had sustained HR in the 140s-160s. It came after two unplanned rides on Friday and Saturday. Today is about clearing that load before Tuesday's first RDL session and Sunday's 5-hour hike. A flat walk increases blood flow without adding stress. The mobility work is the real priority, because hip flexibility drives your saddle comfort and back goals.

OPTIONALITY

The walk itself is flexible, but the 12 min of mobility is not. Your hips and hamstrings are the limiting factor for a lower, more aero PBP position, for avoiding sit-bone blisters and for a back that tolerates RDLs. These tissues only change with near-daily exposure. Skipping today breaks the daily habit this block is built on, and last week's 2.5 minutes showed that habit is the gap.

ALTERNATIVES

- 20 min very easy spin on the trainer at 90-110 W plus the same 12 min mobility
- Mobility only (12-15 min) if your legs are sore from Selbu

PLAN 3 OF 7 · 2026-10-26-GEMINI-4-ARGON

Z.ai GLM-5.3

z-ai/glm-5.3

Full plan	29.6 s / $0.1298
Week + day refresh	15.5 s / $0.0643
Total	**45.1 s / $0.1941**

Season

2026-10-26 → 2027-08-21

GOAL

Finish Paris-Brest-Paris in August 2027 with a comfortable randonneur brevet series (starting with a 200 km in April 2027), while competing in the pole vault world championship on 7 January 2027, losing fat from 24.5% to 15% body fat, and building general cycling fitness for longer tour races.

RATIONALE

The athlete is currently detrained after a July bikepacking race and a low-motivation period, so the season starts with a gentle re-entry and fat-loss foundation. The pole vault world championship on 7 January 2027 is a fixed mid-season event that requires explosive power, sprint conditioning, and technical vault work, so a dedicated vault-specific block with a short taper is inserted before it. After the championship, training returns to the aerobic rebuild through the Norwegian winter using cross-country skiing, snowshoeing, fatbike riding, and indoor cycling, building a broad aerobic base and back-safe posterior-chain strength. From March, road cycling resumes and volume ramps toward the first 200 km brevet in April, followed by a build block that extends brevet distance while adding threshold and VO2 work for tour-race fitness. The final blocks peak with PBP-specific long rides (back-to-back endurance weekends, night riding practice) and a short taper, so the athlete arrives at PBP in mid-August at their peak. This sequencing respects the athlete's belief (well supported by training science) that sustained optimal training only yields progress for a limited period: the truly disciplined, high-specificity work is concentrated in the roughly 4-5 months from March to PBP, while earlier blocks maintain the base, address fat loss, hip mobility, and back-safe strength, and prepare for the vault championship.

First block

2026-10-26 → 2026-11-15

Re-entry & Fat Loss Foundation

FOCUS

Rebuild the training habit with easy, steady aerobic work (easy indoor rides, walk/run, hiking), back-safe gym strength with hip mobility, and establish a sustainable calorie deficit; keep intensity low and protect the back.

RATIONALE

The block's purpose is unchanged: rebuild the habit, restore easy aerobic function, establish the fat-loss routine, and build a back-safe strength foundation before the vault-specific block starts on 16 November. Week 1 is adjusted to absorb the bigger-than-planned 25 October mountain hike and arrive fresh for the 1 November 5-hour hike; week 2 then recovers from that hike before re-establishing the routine, and week 3 consolidates with slightly more volume. The pole vault world championship on 7 January means this block must hand over a consistent routine, a working hip hinge, and healthy hips — not fitness gains — so intensity stays deliberately low and spinning classes remain on hold.

First week

Week starting 2026-10-26

FOCUS

Recovery and easy habit-building, arriving fresh for the 5-hour hike on 1 November

RATIONALE

Sunday's 11 km mountain hike with 608 m of climbing was roughly four times the planned duration and well above the easy HR cap, so this week's job is to absorb that effort, keep everything genuinely easy, and arrive fresh for the 5-hour hike on 1 November. Volume stays low (one easy trainer ride, one gym session, short walks/mobility), all aerobic work is capped at HR 145, and the gym session adds the third goblet squat set plus light Romanian deadlifts with a strict hip hinge and substantially more stretching time, as flagged after the first gym session.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest day with hip mobility** — Full rest from training. Do 10-15 minutes of hip mobility: 90/90 hip switches, couch stretch 1 min/side, deep squat holds 30s x 3, supine hip flexor stretch. This absorbs Sunday's big hike and starts the daily mobility habit.

Title	Easy indoor ride
Type / intensity	workout / easy
Duration	60 min
Status	planned

DESCRIPTION

55-60 min on the trainer in ERG mode. Warm-up 15 min at 100-120 W, then 35 min steady at 140-150 W (cadence 85-95), 5-10 min cool-down. Keep the HR line flat at 125-145 bpm — if HR drifts more than ~10 bpm above target, back off immediately. No surges.

RATIONALE

This session continues rebuilding your aerobic base with the steady, surge-free pattern you nailed on Friday, while staying easy enough to recover from Sunday's hike before the 1 November long effort.

OPTIONALITY

This ride rebuilds the aerobic engine and fat-burning capacity that will carry you through the 200 km brevet in April and ultimately Paris-Brest-Paris, and it reinforces the flat-effort discipline that corrects the surge-recover pattern from 15 October. Skipping it costs a day of aerobic re-building and habit consistency — the whole point of this block.

ALTERNATIVES

- If legs feel heavy from Sunday's hike, cut the steady block to 25 min at 130-140 W

PLAN 4 OF 7 · 2026-10-26-GEMINI-4-ARGON

Z.ai GLM-5.3 Prime

z-ai/glm-5.3-prime

Full plan	71.6 s / $0.1574
Week + day refresh	62.4 s / $0.1299
Total	**133.9 s / $0.2873**

Season

2026-10-26 → 2027-08-22

GOAL

Finish the randonneur brevet series (200 km in April 2027) and complete Paris-Brest-Paris in August 2027, while competing in the pole vault world championship on 2027-01-07, losing fat from 24.5% to 15% body fat, and rebuilding general cycling fitness.

RATIONALE

The season spans roughly ten months from a detrained state to Paris-Brest-Paris in August 2027, with two intermediate peaks: the pole vault world championship on 7 January and the 200 km brevet in April. Given your history of sustaining disciplined training for at most about four months, the plan deliberately avoids one long linear ramp. Instead it uses short, focused blocks with distinct purposes: first a low-intensity foundation phase that rebuilds the aerobic base, hip mobility, and gym strength while establishing the fat-loss habits; then a compressed six-week pole vault specialization with a taper into 7 January, since explosive power, sprint conditioning, and technical vault work need priority and your back-safe posterior-chain loading (RDL progression) is the key risk to manage. After the vault championship we return to winter base on skis, fatbike, indoor trainer, and continued gym work, incorporating the beginner running and rowing programs as cross-training. From March, road cycling resumes and the plan builds toward the April 200 km brevet with endurance volume and tempo work, followed by a short recovery week. The final long block is the PBP build: sustained endurance rides, climbing strength, and back-to-back long rides to prepare for multi-day randonneuring, ending with a two-week taper so you arrive at PBP fresh. Fat loss is pursued steadily throughout via easy aerobic volume and consistent habits rather than aggressive restriction, protecting performance and recovery.

First block

2026-10-26 → 2026-11-15

Rebuild & Fat Loss Foundation

FOCUS

Easy aerobic re-entry (steady indoor rides, hikes, beginner run/walk), hip mobility, back-safe gym strength progression, and fat-loss habits, with the 5-hour hike on 1 November as the anchor event.

RATIONALE

The block's purpose and structure are unchanged, but week 1 is revised to be lighter than originally planned: the athlete's 25 October hike was roughly four times the planned load with HR well above the easy cap, and an unplanned 60-minute ride on 24 October added volume on a planned rest day, so the 'light close' to the re-entry week did not happen. Week 1 therefore becomes a freshness week with two full rest days before the 1 November hike. Week 2 stays a post-hike recovery week with the run/walk reintroduced only if legs are fresh, and week 3 consolidates habits and extends easy volume, ending the block ready for the vault preparation phase starting 16 November. No intensity is introduced anywhere in this block; spinning classes and hard surges remain off-limits.

First week

Week starting 2026-10-26

FOCUS

Freshness ahead of the 5-hour hike on 1 November: short easy sessions, gym session 2 with RDL introduction, and daily hip mobility.

RATIONALE

Sunday's hike was roughly four times the planned load with HR well above the easy cap, and an unplanned 60-minute ride landed on Saturday's planned rest day, so the 'light close' to the re-entry week did not happen. This week is therefore deliberately stripped back: two full rest days early, only short easy aerobic work, no run/walk until legs prove fresh, and the gym session progressing exactly as agreed after session 1 (third goblet squat set, light RDLs, extended stretching). Sunday's 5-hour hike is the anchor: HR under 145 on climbs, summit stops under 5 minutes.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Full rest after Sunday's bigger-than-planned mountain hike (11.1 km, 608 m climbing, HR in the 140s-160s). Do 10-15 minutes of hip mobility: couch stretch 2x60s/side, 90/90 hip rotations 2x10/side, standing forward-fold with soft knees 3x30s, supine piriformis stretch 2x45s/side.

Title	Gym strength session 2
Type / intensity	workout / moderate
Duration	55 min
Status	planned

DESCRIPTION

Warm-up: 5 min easy rowing, HR under 130. Main: goblet squat 3x10 at 12 kg (complete all three sets this time); Romanian deadlift 3x8 with empty bar or 20 kg, strict hip hinge, spine neutral, stop at mid-shin; glute bridge 3x12; lat pulldown 3x10 at 40-50 kg; Pallof press 3x10/side; plank 3x45s. Finish with 12-15 minutes of hip stretching. Total 50-60 min.

RATIONALE

This is the second back-safe strength session of the rebuild, adding the third goblet squat set and introducing light Romanian deadlifts to begin loading the posterior chain through a strict hip hinge — the exact progression needed both for your hip flexibility and back-robustness goals and as the foundation for pole vault loading later in the block sequence.

OPTIONALITY

Skipping this session delays the posterior-chain strength progression that underpins both your long-ride back durability and the vault preparation starting 16 November; with two rest days this week there is no fatigue reason to miss it.

ALTERNATIVES

- If the gym is unavailable: same exercises at home with a backpack/dumbbell, keeping loads conservative.

PLAN 5 OF 7 · 2026-10-26-GEMINI-4-ARGON

DeepSeek V4.1 Flash 1017

deepseek/deepseek-v4.1-flash-1017

Full plan	54.1 s / $0.0342
Week + day refresh	25.1 s / $0.0158
Total	**79.2 s / $0.0500**

Season

2026-10-26 → 2027-08-29

GOAL

Complete the 2027 randonneur brevet series and Paris-Brest-Paris (PBP) in August 2027, while reducing body fat toward 15%, improving hip/core strength and flexibility, and building general cycling fitness for longer tour-style races.

RATIONALE

The season is shaped around the athlete's constraint that disciplined training is sustainable for only a few months, so the early winter is a low-risk rebuild and vault-specific detour rather than an early peak. Training science supports separating general preparation (aerobic base, strength, mobility, fat loss, beginner run/row) from brevet-specific work and final PBP specialization, with recovery weeks and tapers. The 7 January pole vault championship needs a short power/taper block; after it, aerobic volume rises into the April 200 km brevet, then the 300/400/600 series provides race-specific endurance before PBP durability work. Strength and hip/core mobility are maintained year-round because they address back injury risk and sit-bone comfort, while fat loss is pursued slowly to protect recovery and training quality.

First block

2026-10-26 → 2027-01-10

Rebuild, Fat-Loss Foundation & Vault Prep

FOCUS

Re-establish easy aerobic consistency after detraining, build twice-weekly strength and hip/core mobility, start beginner run/walk and rowing, maintain a modest fat-loss deficit, and taper into the 7 January pole vault world championship.

RATIONALE

The athlete is detrained after the July bikepacking race and has a history of back injury and limited hip flexibility, so this block prioritizes low-risk consistency over intensity. Easy cycling at a controlled HR/power cap rebuilds aerobic base without compromising recovery; twice-weekly full-body strength with a hip-hinge progression and daily mobility addresses back resilience and sit-bone comfort; beginner run/walk and rowing add general fitness with low impact. A slow fat-loss deficit protects training quality. The recent re-entry week showed good gym and trainer execution but also an unplanned 2h45 hike above the easy cap, so week 1 keeps extra rest/mobility and delays run/walk until recovery is clear. Because the 7 January pole vault world championship falls inside the block, weeks 6-9 introduce short sprint/plyometric and posterior-chain work, week 10 reduces volume while retaining vault-specific sharpness, and week 11 tapers into the championship and recovers afterward. Winter cross-training replaces some outdoor rides while keeping load controllable.

First week

Week starting 2026-10-26

FOCUS

Re-entry week 1: easy aerobic consistency, strength technique, and protection of Sunday's 5-hour hike.

RATIONALE

The 25 October hike was roughly four times the planned easy run/walk duration and pushed HR well above the easy cap, so this week deliberately keeps Monday, Thursday and Saturday as rest or mobility days. Two short easy trainer rides rebuild steady aerobic control without adding unplanned load, while one full-body gym technique session introduces the third goblet-squat set and light Romanian deadlifts with strict hip hinge. Sunday's 5-hour easy hike remains the key aerobic outing, with HR mostly under 135 and short stops. No spinning classes, run/walk, rowing or hard group rides this week.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Full rest from structured training after Sunday's 2h45 hike. Optional 10-15 min hip mobility only: 90/90 hip switches, hip-flexor stretch, cat-camel, and a short flat walk only if legs feel good. No ride, run, or rowing.

Title	Easy aerobic trainer ride
Type / intensity	workout / easy
Duration	45 min
Status	planned

DESCRIPTION

Indoor trainer: 10 min warm-up at 90-110 W, then 25 min steady at 110-130 W with HR under 130 and cadence 85-95, then 10 min easy cool-down. Keep the effort flat and surge-free; no intervals.

RATIONALE

This short, controlled aerobic ride re-establishes consistency after the over-cap weekend hike without adding meaningful fatigue before Sunday's 5-hour hike. It also supports fat-loss activity and aerobic base maintenance while keeping HR well below the easy ceiling.

OPTIONALITY

Skipping it would cost a low-risk aerobic stimulus that rebuilds the steady endurance needed for the brevet base and supports fat loss; it is short enough that it should not compromise the Sunday hike if kept truly easy.

ALTERNATIVES

- 45 min easy road ride if dry and legs feel fresh
- 30 min easy walk or 15 min hip mobility if fatigued

PLAN 6 OF 7 · 2026-10-26-GEMINI-4-ARGON

Recursive Flint v1.0 (free)

recursive/flint-v1.0:free

Full plan	726.0 s / $0.0000
Week + day refresh	548.8 s / $0.0000
Total	**1274.9 s / $0.0000**

Season

2026-10-26 → 2027-08-15

GOAL

Fat loss and long-distance cycling preparation for Paris-Brest-Paris 2027, including randonneur brevet series.

RATIONALE

The season starts with a low-intensity rebuild and fat-loss foundation after the 1130 km bikepacking race and detraining, using easy volume, strength technique, hip mobility, and nutrition habits. A short vault-specific power block precedes the January 7 pole vault world championship, followed by an aerobic rebuild and winter base. The plan then builds general cycling fitness and endurance, peaks for the April 200 km brevet and August 2027 Paris-Brest-Paris, while periodizing indoor cycling, running, hiking, rowing, staircase, and strength work to avoid unnecessary volume.

First block

2026-10-26 → 2026-12-20

Rebuild & Fat Loss Foundation

FOCUS

Re-entry, easy volume, strength technique, hip mobility, fat loss, and habit building.

RATIONALE

After the 1130 km bikepacking race and detraining, this block starts with very low intensity and conservative strength work to protect the back and hips while building fat-loss and training habits. Progression is gradual through easy volume and strength technique before advancing to the next block. The new week starting 2026-10-26 is a recovery-focused re-entry week following a large mountain hike on 2026-10-25, so volume and intensity remain very low ahead of the 5-hour hike on 2026-11-01.

First week

Week starting 2026-10-26

FOCUS

Re-entry, easy volume, strength technique, hip mobility, fat loss, and habit building

RATIONALE

First week of Rebuild & Fat Loss Foundation after 1130 km bikepacking and detraining; yesterday's hike was more demanding than planned, so today is full rest with hip mobility, tomorrow optional easy flat walk, then rest/mobility and back-safe strength, before Sunday's 5-hour easy hike. Very low target load, no hard efforts, supports fat loss and habit base.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Full rest day with gentle hip mobility after the 5h20 Selbu mountain hike; legs fatigued from sustained climbs, HR in 140s-160s. No training today.

Title	Optional easy flat walk
Type / intensity	workout / easy
Duration	30 min
Status	planned

DESCRIPTION

Optional 30 min easy flat walk at conversational pace, HR <145 bpm, no hard efforts; hip mobility as needed.

RATIONALE

Very low intensity recovery/habit session after the hike; keeps movement gentle while protecting freshness for 5-hour hike.

OPTIONALITY

Optional because skipping this short easy walk is low cost after the 5h20 hike; it builds very low-intensity aerobic habit and recovery toward the re-entry block's easy volume and habit-building focus, while the week's target load is very low. If skipped, the loss is minimal easy movement, but the key recovery is rest today.

ALTERNATIVES

- Rest and hip mobility
- Short easy walk

PLAN 7 OF 7 · 2026-10-26-GEMINI-4-ARGON

DeepSeek V4 Pro 0813

deepseek/deepseek-v4-pro-0813

Full plan	87.2 s / $0.0940
Week + day refresh	38.0 s / $0.0523
Total	**125.1 s / $0.1463**

Season

2026-10-26 → 2027-08-29

GOAL

Complete Paris-Brest-Paris 2027 at a comfortable pace while reducing body fat to 15% and improving core/hip function, with the pole vault world championship on 2027-01-07 as a short-term performance peak.

RATIONALE

The season is shaped around three performance anchors: the pole vault world championship on 2027-01-07, the first 200 km brevet in April, and Paris-Brest-Paris in August 2027, with fat loss and core/hip function as continuous supporting goals. We start with a low-intensity rebuild to restore aerobic capacity and establish fat-loss habits without overreaching, then insert a short explosive-power block for pole vault because that event demands a different stimulus than endurance. After the championship we return to a long winter base using cross-training (skiing, snowshoeing, rowing, running) to build aerobic durability while protecting the back and hips. A brief endurance build prepares the April 200 km, followed by a general cycling fitness block with structured intervals to raise FTP and support longer tour races. The final block specializes in randonneuring volume and tapers into PBP. This order respects the athlete's observation that disciplined training can only be sustained for a few months: we keep maintenance blocks easy and only sharpen for short periods before each key event.

First block

2026-10-26 → 2026-11-29

Rebuild & Fat Loss Foundation

FOCUS

Low-intensity aerobic rebuild, hip mobility, back-safe strength technique, and fat-loss habits; easy indoor cycling, short run/walk, hiking, and beginner rowing.

RATIONALE

This 5-week block rebuilds aerobic capacity and establishes back-safe strength, hip mobility, and fat-loss habits after detraining, while respecting the athlete's need for low-intensity work and the upcoming pole vault championship on 2027-01-07. Week 1 tapers into the 5-hour hike, weeks 2-4 progressively add easy aerobic volume and strength technique, and week 5 consolidates and introduces low-level plyometric/sprint work to bridge into the explosive pole vault block.

First week

Week starting 2026-10-26

FOCUS

Recovery and taper into the 5-hour hike on Sunday 1 November; establish daily hip mobility and back-safe strength technique while keeping all structured work easy.

RATIONALE

The athlete did a longer-than-planned 11.1 km hike on Sunday 25 October and an unplanned 60-minute easy ride on Saturday 24 October, so this week must be genuinely light to arrive fresh for the 5-hour hike on Sunday. Monday and Tuesday stay very easy, with only optional hip mobility and a short flat walk. Wednesday and Friday are short, steady indoor rides at controlled power, Thursday is the planned strength session with the third goblet squat set and light Romanian deadlifts, and Saturday is full rest. Sunday is the main session: a 5-hour easy hike with strict HR and stop discipline.

Today's workout

Tomorrow — 2026-10-27 (today is a rest day)

> Today, 2026-10-26, is a rest day: **Rest and hip mobility** — Complete rest. Optional 10-15 minutes of gentle hip mobility (e.g., 90/90 stretch, couch stretch, hip flexor stretch) to aid recovery from Sunday's longer-than-planned hike. No structured training.

Title	Short flat walk
Type / intensity	workout / easy
Duration	25 min
Status	planned

DESCRIPTION

Short flat walk, 20-30 minutes, keep HR under 145 bpm. Light movement to promote recovery without adding fatigue before Sunday's 5-hour hike. Avoid hills and keep stops minimal.

RATIONALE

After Sunday's longer-than-planned hike and Saturday's unplanned ride, a short flat walk keeps blood flowing without adding fatigue. It is light enough to aid recovery while preserving freshness for the 5-hour hike.

OPTIONALITY

Skipping this walk costs very little because its only purpose is light movement to aid recovery. If your legs feel heavy, full rest is an equally good choice and won't compromise the week.

ALTERNATIVES

- Rest if legs feel heavy
- 20 min easy indoor cycling
